MEDICO-TOPOGRAPHICAL ACCOUNT

OF

AJMERE, RAJPUTANA

BY

LT.-COLONEL P. DURRELL PANK,

INDIAN MEDICAL SERVICE,
RESIDENCY SURGEON, JEYPORE, LATE OFFICIATING CIVIL SURGEON, AJMERE,

WITH ADDITIONAL NOTES

BY

LT.-COLONEL D. FFRENCH-MULLEN, M.D., CIVIL SURGEON, AJMERE.

1900.

CALCUTTA: OFFICE OF THE SUPERINTENDENT OF GOVERNMENT PRINTING, INDIA. 1900.

CALCUTTA:

GOVERNMENT OF INDIA CENTRAL PRINTING OFFICE, 8, HASTINGS STREET.

PREFACE.

THE Medico-Topographical account of Ajmere is one of a series of reports, which are being prepared, under the authority of the Government of India in the Foreign Department, on the recommendation of the Agent to the Governor General in Rajputana, and of the Director General, Indian Medical Service.

With the approval of the Agent to the Governor General, the books are being edited by Colonel Hendley, Indian Medical Service, formerly Administrative Medical Officer, Rajputana, who suggested the preparation of the histories, and wrote the first one on the Jeypore State.

Accounts of the Alwar and Bikanir States, by Major Neilson, M.B., have been published by the Durbars concerned, and the history of Deoli and of the Deoli Irregular Force, by Major Woolbert, I.M.S., has also appeared. The general account of Rajputana by the Editor is also ready for publication.

The Ajmere work was written by Lt.-Colonel Pank when he was acting as Civil Surgeon during the absence on furlough of Lt.-Colonel ffrench-Mullen who has therefore added a few remarks embodying his own experience of the station and district.

T. H. HENDLEY, Col., I.M.S.,
Inspector-General of Civil Hospitals, Benyal.

MEDICO-TOPOGRAPHICAL ACCOUNT

OF

AJMERE.

GENERAL DESCRIPTION.

JMERE-MERWARA is an isolated British district in Rajputana, lying between 25° 30′ and 26° 45′ N. latitude and between 73° 53′ and 75° 22′ E. longitude, with an area of 2,711 square miles and a population, according to the census of 1891, of 542,358 souls.

The district comprises the two tracts known as Ajmere-Merwara, and is entirely surrounded by Native States.

Ajmere is bounded on the north by Kishengarh and Marwar, on the west by Marwar, on the south by Meywar, and on the east by Kishengarh, Jeypore, and Meywar.

The District of Ajmerc-Merwara occupies the crest of the great Rajputana watershed, the rain which falls upon the summit finding its way either by the Chambal into the Bay of Bengal, or by the Luni into the Gulf of Cutch. The plateau on whose centre stands the town of Ajmere may be considered as the highest point in the plains of Hindustan; and from the circle of hills which hem it in, the surrounding country slopes away on every side—toward river valleys on the east, south, and west, or the desert region on the north. The Aravalli Range, which divides the plain of Marwar from the high tableland of Meywar, forms the distinguishing feature of the district. Rising first from the alluvial basin of the Jumna into the ridge at Delhi, this broken chain runs south-westward across the Rajputana States, and crops out to a considerable height near the town of Ajmere, where it assumes the form of several parallel hill ranges. The greatest elevation, on which is perched the fort of Taragarh, rises immediately over the city 2,855 feet above the sea level and about 1,300 above the valley at its base.

Owing to its elevated position at the centre of the watershed, Ajmere-Merwara possesses no rivers of any importance. The Banas, its principal stream, rises in the Aravalli Hills 40 miles north-west of Oodeypore, and skirts the south-east border without

entering the district; during the rains it becomes unfordable. There is a good ferry at Negria, which is kept up by the Public Works Department and is paid for by the Jeypore Darbar. Four other insignificant rivulets, the Khari Nadi, the Dai Nadi, the Sagarmati, the Saraswati, swell into violent torrents after heavy rains. The great tank embankments form the most interesting feature in the hydrography of the district. They are constructed by damming up the gorges of hill streamlets, and several of them date back to periods long anterior to the British occupation. As many as 419 of these valuable works now irrigate and fertilize the district, due in most part to the untiring energy and benevolent exertions of Colonel Dixon, who administered various portions of this district from 1836 to 1857. The tanks become dry by the month of March, and their moist beds are then cultivated for the spring crops. Four small natural reservoirs, scarcely deserving the names of lakes, are also found in the depressions of the sandhills, the most important of which is the sacred lake of Pushkar. The district was entirely denuded of trees long before the British period, but great pains have lately been taken for re-foresting the arid hill-sides.

The census of 1891 returned the population of Ajmere-Merwara at 542,358 souls; inhabiting 2,710 square miles, and distributed amongst 101,654 houses, with the following results:—persons per square mile 200, houses per square mile 37.5, persons per house 5.33. Of the total population, 288,325 were males and 254,033 females. According to religion the numbers were as follows:—

Hindus	ar	id '	Ved	S		•	43 7,9 88	1	Mussalmans	•	•	•	74,265
Jains		•		•		•	26,939		Christians	•	•	•	2,683
Sikhs		•		•	•	•	213		Others .	•	•	•	270

In the two districts there were in 1891 four towns and seven hundred and fortyone villages; the average area of the towns was 10'1 square miles, and of inhabited
villages 4'9 square miles in Ajmere and 1'9 square miles in Merwara. The population
of Ajmere City is 68,843, and the increase since 1881 has been 20,108, or 41'2 per cent.,
namely, 36'3 per cent. of males and 44'2 per cent. of females. In 1837, the population
of "Ajmere proper" was only 23,432. Hindus now number 36,729, Muhammadans 26,433,
Jains 2,770, and the disciples of Arya Samaj number 1,097.

Muhammadans have increased 41 per cent. and Hindus by 39 per cent. The total population employed in, 6r dependent on employés of, the railway in Ajmere is 10,050; the railway, therefore, supports 14 per cent. of the total population.

Ajmere City dates from about 1210 A.D., and the main portion within the massive enclosure walls was probably very extensively built over a century ago.

The city lies to the north on the lower slopes of Taragarh Hill; and the view from the tops of the houses commands the whole valley. Outside the walls the city has gradually extended, and beyond the city extensions are the buildings of the railway staff and premises, which continue to about one and a half miles south of the city wall, and the houses of the railway officers and office employés are distributed on both sides of the valley. These, with the military cantonment, civil buildings, and all others without the city walls, are classed as the suburbs of Ajmere.

The population, according to the census taken in 1891, was, total population 68,843, comprised as follows:—

Inside city walls	•	•	•	•	•	. •	•	•	41,416
Outside city walls	•	•	•		•	•	•	•	11,585
Suburbs	•	•	•	•	•	•	•	•	13,746
Cantonment .	•	•	•	•	•	•	•		1,814
Railway passengers	•	•	•	•	•	•	•		282

That part of the city enclosed within its walls is about one mile in length, and about mile in breadth, and its area is about half a square mile. The city walls completely enclose it and average 12 feet thick by 20 feet high; it has five main entrance gates, and a few other entrances have been made through the city walls.

The plan of the city is evidently undesigned, and has, like most old cities, grown in the course of centuries to be very irregular, complicated, and overcrowded with buildings. There can be said to be only three main streets, two straight ones running north and south, the Naya Bazar and the Durgah Bazar, about 40 to 50 feet wide, and one running east and west very irregularly, about 25 feet wide, the Nullah Bazar, which latter carries off a great deal of the drainage and pours it into the Bisla tank.

Neither the Naya nor the Delhi Bazar penetrate much more than half the length of the town; they end at the Nullah Bazar; the blocks between these three main thoroughfares are divided up into irregular mobullas by tortuous and extremely narrow thoroughfares, which vary from 7 to about 15 feet, the majority not being over 10 feet wide; and these mobullas themselves are subdivided by still narrower passages and gullies, some of which are only 3 feet wide.

The Ajmere style of building delights in projections over the streets and lanes of balconies, and into the road-way of steps and chabutras, and the absence of a proper detailed map demarking public from private property, and the impossibility of promptly detecting encroachments or even proving them, has led to the construction of such a maze of buildings and projections that a complete detailed survey of the town would now be a very difficult and expensive matter.

The two main streets, Naya and Durgah Bazars, are kunkur metalled and have side drains covered with chabutras; the Nullah Bazar was laid with heavy paving about twenty years ago as the floods during the rains did much damage. The rest of the town is unpaved and more or less undrained by artificial means. Owing to the situation of the city the outfall is good and all surface water rapidly escapes. Consequent on the excessive overcrowding of the houses and the narrow lanes and gullies ventilation and perflation of air is very much impeded.

The city is divided into eight wards. The suburbs are much better off for streets, and there is far less overcrowding of lanes and houses, and consequently better ventilation and perflation of air.

The suburbs are divided into two wards.

An ordinary house in the city, of a well-to-do citizen or of a householder with a moderate income presents, the following features:-the house may be of two or three stories: on the ground-floor an open courtyard, generally of small dimensions, is surrounded by small, dark, ill-ventilated rooms; on this floor also, as a rule, one or two privies are built into the house; these lower rooms are frequently occupied by cows and goats, the family living in the upper stories; if facing a street, they are often let to shopkeepers: one or more drains traverse the courtyard and are there to carry off sullage and other dirty water. These drains are, as a rule, so badly constructed that they permit free percolation of water into the surrounding soil, as well as stagnation of putrid water: they lead to a cesspool of masonry, which is frequently nothing more than a hole in the ground. Into this courtyard is thrown, or conducted from the upper stories, some or all of the waste water of the house, and the effluvia or unhealthy exhalations arising from such an arrangement can be imagined. In a large number of houses this waste water is got rid of by unglazed earthen pipes or tin pipes fixed to the outside walls, and ending in a moveable receptacle which, when full, is emptied into the municipal conservancy cart. These pipes are very defective and often leak and so allow the dirty water to soak into the walls.

The upper stories of the house are comprised of rooms of two kinds: they are small, and are either completely open on one side and so are a kind of enclosed and covered in verandah, or an ordinary room of four walls with doors and windows, the latter being unglazed and closed by small shutters. These are the living rooms; they are generally much too small and are badly ventilated; in large houses these rooms face inwards to the courtyard.

The house is built entirely of stone, and in the hot season is unpleasantly warm and in the winter abnormally cold. In some houses the upper story is tile-roofed, which permits of freer ventilation. The stair-cases of these houses are of stone, are very narrow and badly lighted. The chief defects in these houses are small rooms, insufficient lighting and ventilation, and a badly arranged system of getting rid of waste water.

The privies are emptied daily by private sweepers in most cases, and by municipal sweepers in others; these men take the night-soil to the nearest conservancy cart.

FOREST,

In olden times the hills about Ajmere were probably covered with scrub jungle, and where the growth has been unmolested, as on the west side of the Nagpahar Hill, there are still some trees on the hill-side. With this exception, however, the Ajmere district was denuded of trees long before the commencement of British rule, and the Mahrattas are generally given the credit of the denudation. The parts of Merwara adjacent to Ajmere are described by Mr. Wilder, an eye-witness in 1819, as an "impenetrable jungle"; though now, except in the extreme south, where there is no local demand for wood and timber, and from whence carriage, till recently, was quite impracticable, Merwara is not much better off in this respect than Ajmere. The trees which existed could only have been scrub at the best, and the demands of the town of Beawar, of the Cantonment of Nasirabad, and for wood to burn lime for the tank embankments, joined to the absence of all attempts at replacing

what was destroyed, has left but few trees in any accessible part of the district, and wood of all kinds is exceedingly scarce and dear.

The following is taken from the Church Book, Nasirabad,—"The Delhi Gazette (of Agra) reprinting 'A Plea for Tree Preservation in India," by Surgeon-Major William Curran, A. M. D., in its issue of 19th October 1877, has the following:—

"Mr. Baden Powell, in his able report on the Forest Department for 1872-73 pages 51 and 52, says—

"Denudation of forests has the most lamentable results. A good instance of this is afforded by the little British States of Ajmere and Merwara in Rajputana. * * *

"The hills were formerly densely covered with thorny jungle and with Boswellia and Acacia. They were so densely covered in fact that the wood was cut down because it gave shelter to bands of robbers. Charcoal burners and others did the rest, and now nothing remains but bare hills. Hence droughts and desolation have followed.

* * "

Mr. Curran in a foot note quotes:—" Dr. Irvine as thinking that the growth of wood in the now bare hills of Ajmere would in time be highly beneficial to the health of the inhabitants, and he ascribes the excessive heat that prevails in that district to the destruction of forests that took place under the sway of the Mahrattas."

"The General and Medical Topography of Ajmere, pages 63 and 75, by Dr. Irvine."

The natural forest growth chiefly consists of the following trees and shrubs, vis., Saler (Boswællia Thurifera), Gol (Odina Wodier), occupying the summits and upper slopes of the hills; Dhankra (Anogeissus Pendula), together with Kalia (Albizzia Odoratissima) and Khair (Acacia Catechu), lower down on slopes with a gentle gradient; Kamta (Acacia Rupestris) at the base; and Khejra (Prosopsis Spicigera), Arinja (Acacia Leucophlea), Nim (Melia Indica), D'ansan (Rhus Mysorensis) and Khairi (Dichrostachys Cinerea) on the plains. The banks of most streams are fringed with Dhak (Butea Grandosa), Jaman (Eugenia Jambolana), Keim (Nauclea Parvifolia) and Gular. Of these trees Dhankra forms the best wood for fuel and charcoal, and also furnishes small timber for roofing huts; Babul (Acacia Arabica) generally grows near village lands, and large sized trees supply wood useful for building and agriculture. Exotic trees are difficult to rear and will only grow near wells or where they can be artificially irrigated; they are the Farash (Tamarix Orientalis), Siris (Acacia Speciosa), Gular (Ficus Glomerata), Tamarind (Tamarindicus Indica), Mohwa (Bassia Latifolia), Mango (Mangifera Indica), Sisham (Dalbergia Sissoo), the cork tree (Millingtonia Hortensis), Chirria (Ponjamia Glabra), Grevillia Robusta and Eucalyptus. None of these will grow on the hill slopes, and only thrive in good soil, while the necessity for irrigating the plants when young renders their nurture expensive.

The most common grasses are Mung (Saccharum Sara) growing on sandy soils, Sairan (Ischoemum Saxum), one of the best fodder grasses, Surwala (Heteropogon Contortus) or the spear grass, Bhangta (Opluda Aristola) and Lanpla (Aristida Depressa) an inferior grass.

In addition to the climatic advantages which are claimed as the results of forestration, the object of the Forest Department in Ajmere is also to form reserves of fuel and fodder and to afford pasture for village cattle in years of scarcity of fodder. Twenty-four tracts

aggregating an area of 89,178 acres or about 139 square miles have been taken up in Ajmere-Merwara. In the famine of 1891-92 grazing was allowed over all the forest reserves, and thousands of cattle, which would have otherwise perished, were saved.

DRAINAGE.*

The city of Ajmere is built on the slopes of the Taragarh hill and is thus provided with a natural surface drainage: the slope to the outer gates of the city is in places very steep, and in times of heavy rain the rush of water through the Madar Gate attains to a depth of two and three feet; other than these natural flushings, which only occur in the rains and then perhaps not more than four or five times to any great extent, there is no system of drainage; so that in Ajmere City, as in the great majority of Indian cities, the soil is daily and constantly polluted, and this has gone on since the city was built, and the soil is black, from the accumulations for centuries of decomposing and offensive matter. The surface water escapes by various channels which ultimately find their way to the Bisla tank, and the quality of the water of that tank can be imagined after an inspection of the city streets and lanes.

WATER-SUPPLY.+

"There is no permanent supply in the wells of the district; they all depend upon the rainfall. In the Ajmere district, where the beds of the nullahs are sandy, a sufficient

* Foot-note—By the Secretary to the Agent to the Governor General in Rajputana "There is no system of a drainage."

The description given in pages 3 and 4 of the present crowded and ill-ventilated streets, the construction and arrangement of the maze of houses and court-yards, foully insanitary, are evidence that no useful system of drainage is possible without a re-construction of the city. The climate of Ajmere is intensely hot and rainless for nine or ten months of the year and affords no water-supply for flushing of drains.

During the rains the town is scoured out periodically about half a dozen times. This cleanses the surfaces of court-yards and the street side drains, most of the latter having a steep slope. The court-yards and the portions of houses set apart for latrine arrangements remain toul all the year round; the sun is the great disinfectant for nine or ten months of the year. I do not consider that the soil and buildings of the Ajmere City proper (i.e., within its walls) can be improved by any system of drainage. A great deal could, however, be done by removing the city wall, which at present encloses back premises and obstructs perflation of air, and by inducing people to remove outside into the suburbs. As buildings fall in they should not be rebuilt and all new construction, whether of balconies or houses within the town, should be entirely forbidden.

† Water-supply.—Budha Pushkar is the only lake which contained water during the famine of 1891-92. The water famine in Ajmere was then so severe that pipes were laid on to it and water was pumped up 300 feet over the ghat for a period of five months; the cost of pumping was very great, Rs. 4,000 to Rs. 5,000 monthly. The pipes used were those intended for the water-supply from the Foy Sagar. When the rains came and the Foy Sagar was ready, this special supply from Budha Pushkar ceased and the pipe system was taken up and relaid as part of the Foy Sagar scheme. It has been shown to be tolerably certain that in a drought similar to that of 1891-92 the Foy Sagar will fail, and recourse must be had again to Budha Pushkar.

Budha Pushkar, however, could only be used as a water famine assurance in occasional years, as the cost of pumping is at other times prohibitive. The Budha Pushkar water has been analysed and condemned. It shows, however, a better analysis than that of the Foy Sagar. The Roy Sagar supply must of necessity be the usual supply in ordinary 'years. It is at any rate much better in quality than the old supply from the Aca Sagar, and as it commands the city by gravitation, the daily cost of bringing it in is nominal. The leakage of the Foy Sagar might be utilised for the supply of the dhobies, cisterns. This, however, would involve pumping.

The Foy Sugar has as yet not filled and usually only collects one year's supply. In 1894 it did not rise during the rains.

The Ana Sagar is now so very shallow as to be of little use. It frequently dries up, and in so doing is very offensive.

D. JOSCELYNE, C.E.,
Supdg. Engr. & Sccy, P. W. D.,
Rajputana and Central India.

amount of water is absorbed during the rains to supply the wells on either bank; but wells can only profitably be made within a short distance from the stream, and beyond that stretches unirrigated land to the base of the hills on either side. In Merwara, where the beds of the drainage channels are rocky and the slope of the country greater, the rainfall, if unarrested, rapidly flows off into Marwar and Meywar, and but little benefits the country, as the soil is shallow and unretentive of moisture. The configuration of the districts with a more or less rapid slope from the watershed, rendered it imperative to provide for the retention of the rainfall by artificial means, while the undulations of the ground and the gorges, through which the hill streams had worn a passage, rendered it practicable to retain the rainfall by a system of embankments.

"The idea of such embankments was one which early presented itself to the minds of those conversant with the district. The Bisla tank was made by Bisal Deo Chauhan about the year 1050 A.D.; his grandson Ana constructed the Ana Sagar. The tank at Ramsar was built by Ram Deo Pramar. In Merwara the large tanks of Dilwara, Kalinjar, Jowaja and Balad date from long before our rule. They are formed by a wide earthen embankment, generally faced on both sides with flat stones laid horizontally, and closing gorges in the hills. With ordinary care they will last as long as the hills which they unite, and their construction furnishes a substantial proof that before our rule the principles of subordination and co-operation were not unknown in Merwara.

"The tank embankments of the district at present number 419, of which 168 are in Ajmere, 183 in the Beawar Tehsil, and 68 in the Todgarh Tehsil. They have been often described, and Colonel Dixon in his 'Sketch of Merwara,' Chapter XII et sequitur, has given a very full account of them.

"With the exception of the few tanks constructed before 1818, and seven tanks built by Colonel Hall in Merwara, the remainder owe their existence to the unaided and untiring energy of one man who ruled Merwara from 1836 to 1842, and the united districts from 1842 to 1857, when he died at Beawar. The name of Colonel Dixon will be remembered in Ajmere and Merwara for many generations. For years he worked steadily at this single object without help or sympathy, and without much encouragement; for, until the works were completed, they attracted but little attention, and the district was too remote to allow of the Government of the North-Western Provinces taking at first an intelligent interest in the work. With such help as his Tehsildars and a few trained chaprassies could give, Colonel Dixon constructed all these works, and it was only in 1853, when the tanks had been completed, that the appointment of an uncovenanted European Assistant was sanctioned. Nothing worthy of note was done after Colonel Dixon's death till the establishment of the Ajmere Irrigation Division of Public Works in the beginning of 1869. The tank which was constructed in 1870-72 at the Jagir Village of Bir is a fine example of the best class of masonry dam.

"Colonel Dixon was of opinion that the tanks had raised the water level of the country, and there is no doubt that subsequently to their construction wells were made in many

places where the experiment had been tried and proved unsuccessful. The opinion of a Committee assembled in 1874 to discuss the subject of water revenue assessment was that about half the wells in the district owed their supply to filtration from the tanks. Major Lloyd, Deputy Commissioner, writing in 1860, was of opinion that from the moisture preserved in the soil, and the great increase of vegetation they have helped to create, the reservoirs have been to some extent instrumental in causing the increased supply of rain which has been measured in the last few years.

"Nearly all the tanks are dry by the month of March, and the beds of the majority are cultivated for a spring crop. There is hardly any produce from the reservoirs themselves. Waternuts are not grown, fish are caught in the Ana Sagar and in the Ramsar and Nearan tanks; but the people do not eat fish, and it is only in the Ana Sagar and the sacred lake of Pushkar that fish permanently exist, while religious prejudice prevents their being killed in the latter lake.

"Besides the artificial reservoirs, there are four natural reservoirs in the district, which, in less dry countries, would hardly deserve mention. These are the sacred lake of Pushkar and the lake known as old or Budha Pushkar near the former. Both are depressions among sand hills without any outlet, but exercise a considerable influence by percolation through the sand hills on the low sandy bottoms in their vicinity. In Merwara there are two natural basins, that of Sargaon and that of Karantia, both near Beawar. A passage for the escape of the water of the former has been cut through the encircling sand hills, and the bed is now regularly cultivated for the spring crop. That of Karantia lies amongst hills, and is of no use for irrigation."

The above is taken from Mr. La Touche's report on the Settlement of the Ajmere and Merwara Districts, published in 1875. The following is made up from notes very kindly supplied to me by Major E. C. Spilsbury, R.E., Public Works Department, Ajmere, and from notes on the sanitation of Ajmere by Mr. D. Joscelyne, C.E.

The number of tanks of the first class which are repaired by Government is as follows:—

Ajmere	¢	•	•		•	•	•	•	•	•	•	119
Merwara				•	•	•	٠,	•		•	•	239
												-
								T	OTAI		•	3 5 8

And the great difference in numbers between the two is due to the fact that in Ajmere there are a very large number of tanks on private estates, whereas in Merwara there are few or none of this class.

All the above are irrigation tanks and those in the vicinity of villages and towns, both influence the wells in their neighbourhood, and themselves form a source of supply of drinking water as long as water remains in them.

The greater number of these tanks become dry in the hot season as they, as a rule, are too shallow to last from one rainy season to the next, nor is the rainfall sufficiently large to ensure their being filled every year. After drying up their beds are cultivated.

The following are some details of a number of the principal irrigation tanks:-

	Name.				Capacity in million cubic feet.	Water spread in million cubic feet.	Greatest depth when full above sluice.	Clear catchment area in square miles.

AJMERE CITY.

Apart from the supply of water got from wells in the city and suburbs, Ajmere City depends solely on two tanks for its drinking water, vis., Foy Sagar and Ana Sagar. former was constructed in 1891-92 and the latter by Ana, grandson of Bisal Deo Chauhan some time in the twelfth century. The Foy Sagar is the more important of the two tanks as it supplies the city with drinking water. The Ana Sagar, which formerly supplied drinking water to the city, is now almost entirely used for other purposes, such as irrigation, water for dhobies' ghats, etc. In years of scanty rainfall, which happen in Ajmere more or less regularly every three years, these tanks run very low. The Ana Sagar sometimes dries up completely, and the Foy Sagar since 1892 has been very low, so that it is highly probable that some time or other these sources of water will fail, and then some other supply must be looked for. It is believed that such a source exists at Budha Pushkar, where there is a natural tank of water which has never been known to go dry. This tank is 6 miles distant from Aimere, and water was brought to the city from this tank by means of water pipes and pumping machinery in 1892. This arrangement, which will doubtless have to be made permanent in the near future, will be utilized in times of water famine and when the Ana and Foy Sagars are exhausted. The Foy Sagar Reservoir is situated about 3 miles from Aimere and was constructed during the famine of 1891-92, and opened in 1892,—the cost of construction and compensation for land taken up was Rs. 1,07,000, to which should be added Rs. 92,000, for the pipe line which was previously used for bringing water from Budha Pushkar to Aimere.

The annual cost of maintenance, repairs, etc., to the tank, and of the whole system of water-supply including that of the Ana Sagar, amounts to Rs. 2,500; the following figures refer to the size and capacity of the Foy Sagar:—

Capacity when full-150 mill. cubic feet.

Greatest water spread—14 mill. square feet.

Depth above sluice when full-24 feet.

Catchment area—8 square miles.

Of which half a square mile is taken up by the lake when full.

Of the catchment area:-

- 13 square miles consists of conserved forest area.
- 1 3 , are under cultivation.
- 4 are ordinary jungle, mostly rocky.

There are two villages, Ajera and Kharekri, within two and three miles, respectively, of the nearest point of the tank.

The tank is almost entirely surrounded by cultivated land, which not only intercepts the flow off, but leads to pollution of the water; there is also a fair amount of traffic over the catchment area to and from the villages, so that on the whole the catchment area is by.

no means as uncontaminated as it should be. No villages, or road traffic, or cultivation of any kind should be allowed within the catchment area of this tank.

The water of the tank has been chemically analysed every month since December 1895, and is reported as unfit for potable purposes. This is because of the amount of albuminoid ammonia which it contains, and which may be due to decomposed vegetable matter within the catchment area, and which, as time goes on, may decrease.

The consumption for 1895 averaged 240,000 gallons per diem, and varied from 180,000 in January to 344,000 gallons in May. This included all water conveyed by the pipe for all purposes, including the railway. The Foy Sagar is calculated to contain, when full, a two years' supply of water, as used at present. There are two small filter tanks from which the water is conveyed to the town for distribution. They are utterly inadequate, and do not materially influence the purity of the water.

There are 124 public hydrants distributed throughout the city and station and 85 private house connections.

THE ANA SAGAR TANK.—This tank is now only used for irrigation purposes, and to supply the dhobies' ghats in the Bisla and for bathing purposes. Dhobies are not permitted to use the tank for washing purposes.

As the Foy Sagar now intercepts a large proportion of water, which previous to 1892 found its way into this tank, the Ana Sagar will not contain so much water or fill so often as formerly.

There is one other tank in Ajmere which calls for special notice, viz., the Bisla, and the great importance of this tank is attached to the question as to whether it should remain empty or be allowed to hold water.

The best account of the history of this tank is to be found in Mr. D. Joscelyne's notes on the sanitation of Ajmere, and as this question of the advisability or otherwise of closing or opening the sluice of the Bisla has acquired the habit of being brought forward periodically, it is very necessary that the facts recorded by Mr. Joscelyne should not be lost sight This Bisla tank is probably one of the oldest, if not the oldest tank in Ajmere, and in Mr. LaTouche's Report on the Settlement of Ajmere and Merwara Districts it is recorded that the Bisla tank was made by Bisla Deo Chauhan about the year 1050 A.D. It lies in the direct water outlet of the valley in which the City of Ajmere is built, and was doubtless when first constructed, a very large and useful tank on which the city people depended for their tank water. Since the Bisla was built the Ana Sagar and the Foy Sagar have been constructed, and they intercept and retain a very large proportion of the water which comes from the open country and from the least contaminated sources. One source which is greatly contaminated, and the water of which it is no exaggeration to describe as sewage, still supplies the Bisla with water, and this source is the area to the north-east of Taragarh and which includes the greater part of the city of Ajmere; and when one remembers what the sanitary condition of an Indian city like Ajmere is, with a population of 69,000, and which until 1875 was not possessed of any system worthy of the name of sanitation, it is not to be

wondered at that surface water coming from such a source should be so contaminated. Any one wishing for ocular and nasal demonstrations of the condition of the water flowing from the city to the Bisla, should stand near the current as it sweeps along at the beginning of the rains.

Here follows what Mr. Joscelyne says in his "Notes" above referred to:-

"The cutting of the Bisla tank being a matter of great importance in its effects upon the drainage of the valley deserves careful consideration. Prior to 1883, the lower parts of the valley suffered considerably from excess of moisture. I lived in Ajmere from 1873 to 1875, and well remember that water could then be found in the centre of the valley quite close to the surface. The records show that as far back as 1872 great efforts were made to improve the drainage of the valley. Major Williams, who was then Irrigation Engineer at Ajmere, was called upon for a scheme, and he strongly advocated the necessity for cutting the Bisla as the only efficient remedy. As, however, the Bisla Tank was at that time the chief resort for dhobies, bathers, and cattle, this measure was strongly opposed by the Municipal Committee. As a temporary expedient, a fairly deep drain was cut down the centre of the valley from the Dowlat Bagh to the Bisla tank, at an estimated cost of about Rs. 7,000. This was an improvement, but until the Bisla tank was drained in 1883, the centre of the valley was very much water-logged.

"The map shows that the water spread of the Bisla tank occupies the very heart of the valley. The dam being constructed across the valley, this tank receives nearly the entire drainage of the Ajmere City and Suburbs. It will be readily understood that the water thus collected was of a foul description, and only fit for irrigation. For several months after the rains, and especially during the months of still hot air (September and October and part of November), this large pool of foul stagnant water gave out unwholesome exhalations as well as unpleasant odours while drying up. As the suburbs of Ajmere extended, this tank became surrounded by dwelling houses occupied chiefly by the Railway officers and employes. The tank then became such an intolerable nuisance that in August 1883 a Special Committee was convened by the Assistant Commissioner to report upon it. The President was Major O. M. Creagh, Commanding Officer of the Merwara Battalion; and the members were Doctor Newman, Civil Surgeon of Ajmere, Doctor Willmot, Surgeon, Rajputana-Malwa State Railway, C. Target, Esq., Executive Engineer, Ajmere Provincial Division, and Campbell Thomson, Esq., Executive Engineer, Rajputana-Malwa State Railway. The opinions of four Medical Officers were taken, viz.:—

- Dr. Willmot, Principal Medical Officer, Rajputana-Malwa State Railway.
- Dr. Newman, Civil Surgeon of Ajmere.
- Dr. Husband, Medical Missionary.
 - Mr. Pierce, Apothecary, Rajputana-Malwa Railway.

"Their opinions (attached to this report as Appendix B) unanimously condemned the take and recorded the necessity for draining it in order to render the adjacent dwellings safe for habitation. Dr. Newman adds in his report: 'I think it also affects the ground between the Bisla and the Ana Sagar by forcing back the sub-soil water and keeping.

the ground damp. The sites near have always been considered unhealthy and were avoided until pressure of space obliged people to build there.' These opinions were given on oath before the Assistant Commissioner. The Special Committee were unanimously of opinion that, both for sanitary and engineering reasons, this lake should be drained at once before more rain falls. These proceedings were forwarded to the Local Administration and also a resolution of the Municipal Committee, to drain the lake. The escape was cut, I believe, as an urgent measure, in anticipation of the sanction of the Chief Commissioner, which was subsequently received. The tank has thus remained dry since August 1883. From complaints which have reached me on every hand during the past four years, I learn that the cutting of the Bisla is considered to have injuriously affected the well level throughout the valley. Unfortunately I have no recorded data of well levels prior to 1883 to afford a fair comparison with subsequent levels. There is only a record of wells at the close of the rains in 1882."

"As many persons seem desirous of rebuilding the Bisla dam in the hope of improving the water-supply, I have thought it necessary to record its history. The tank was formerly used, as most tanks are, for bathing, watering cattle, washing and dyeing of clothes, for irrigation, and for drinking purposes. If it be restored, it will certainly be so used again. The new masonry cisterns in the Bisla meet all the wants of the dhobies, and the cattle trough also meets the question of watering of cattle. These and the new pathing ghats will be described subsequently in the report. I do not see how any sanitary engineer could recommend the restoration of the Bisla. It has been suggested that foul drainage from the town should be diverted, so as not to flow into the tank, and that only fairly clean water from the eastern side of the valley, and the occasional overflow from the Ana Sagar ake, be stored in it. In my opinion this proposal, though possible, is infeasible. The land to the west above the Bisla is so crowded by buildings, and the railway premises that a diversion channel could never be sanctioned, and even if carried out, the Bisla supply thus limited would be insignificant."

The danger of this tank, when allowed to hold water, to the city and cantonments of Ajmere, after a careful consideration of the foregoing facts, cannot be questioned; and the only reasons which can be adduced in favour of allowing it to hold water, are, that wells in its vicinity are more liable to go dry, and that some land near the area of the tank is less productive; these reasons are trivial and, insufficient when compared with what happens when the bund is intact and liquid sewage is allowed to flow into the area of the tank, namely-water-logging the land above the tank and up to the Dowlat Bagh, and the dangerous menace to the health of those living on and in the vicinity of that land.*

The following table shows the analysis of all the principal sources of drinking waters used in Ajmere.

^{*} In this opinion I fully concur after 26 years' knowledge of Ajmere. - T. H. HENDLEY.

SANITATION.

The following is taken from "Notes on the Sanitation of Ajmere," by D. Joscelyne, Esq., C.E., 1888, which is a very valuable contribution to the subject, and should be carefully consulted when improvements or alterations in the sanitation of Ajmere are contemplated:—

"The Conservancy of Ajmere has been a very troublesome question for many years past, and the records shew that the local authorities have, since 1876, perseveringly endeayoured to improve the state of the town and valley. The collection of night soil in the city has always been in the hands of sweepers, who are employed and irregularly paid by private individuals in the town. This system has never been controllable, and is as objectionable now as it has always been. The cleansing of the outskirts of the city and suburbs and the houses of the poorer classes, is mainly undertaken by the municipal conservancy staff; private sweepers also do some of the work. The disposal of the stuff for years baffled the ingenuity of the municipality. The new tramway system opened in May 1886, at a cost of Rs. 84,000, solved this part of the problem. Prior to 1876 night soil was trenched in open places in and about the city, and upon the fields in the valley. In 1876 it was trenched in a confined area above the north-west of the town, before referred to as the "Lungya," The drainage from the hills passes over this site, and there are drinking wells below it. This place soon became filled up, and the practice of removing the night soil to trenches and pits near the city continued up to the time the tramway was opened, though latterly much was carried 3 miles away on the Nasirabad road. The cart system quite broke down, and trenching in the valley, as the Suburbs extended, became a serious nuisance. With the present tramway system the difficulties of carriage and of a suitable and sufficient trenching site disappeared. If the collection was equally well done there would be little to complain of in the present conservancy establishment. The collection is performed, in the case of private houses and private latrines, entirely by a class of men known as "Birat" sweepers, who are in the pay of the tenants and householders. The public latrines and urinals are cleared by the special municipal staff. "Birat" sweepers are a hereditary class who have always undertaken this work for private individuals. They are in no particular employ, but receive renumeration, more or less gratuitous, chiefly in kind, sometimes in small sums of money. The advantages of the Birat system of collection are:-

- 1. Its cheapness. The municipality would have to pay heavily for a similar staff of regular workers.
- 2. These time-honoured servants can obtain access to private dwellings more readily than the paid servants of a municipality.
- 3. It is, in an imperfect way, controllable by the people who are benefited, and whose interest it is to have their places cleaned.
- 4. The people benefited pay for it, and the payment being mostly in kind, falls very lightly upon them.

It disadvantages are evident:-

- 1. The Birat of each family of sweepers is so scattered and the work is so unequally divided that it cannot possibly be effectually done. Some Birats are much more valuable than others, and the hereditary owners of these naturally will admit no one to share in their "Birats" if they can possibly avoid it. One Birat family has as many as 705 houses in wards 3, 5, and 6, another has 259 houses in wards 1, 2, 3, 4, 5 and 6, and one has as few as 10 houses to look after.
- 2. It follows from the above that the municipality has very little control over these men. The sweepers object to employ extra labour to do the work of a too large Birat, and the householders say they pay as much as they can afford. Of course, complaints are rarely made, as they might lead to investigation of private premises, a thing which is disliked of all others, so that residents accept their discomforts, and are at the mercy of these men. The payment in kind or in money to the owners of Birats is so indefinite and irregular, and due from so many persons, that there is practically no individual control over the sweepers nor over those who ought to pay them.
- 3. The Birats are so entangled that it is very difficult to trace neglect to the party in fault."*

From a note written by the Judicial Assistant Commissioner, Munshi Ameer Chand, in May 1877, I quote the following particulars:—

"At that time one-fourth of the houses had no Birat sweepers at all, and the wages of each sweeper was estimated in kind and in money to average about Rs. 4 or Rs. 5 per month. The number of sweepers were then estimated at 280, and the aggregate incomes at Rs. 16,800 annually. I have no reliable estimate of the numbers of sweepers at present. The list attached shews 97 sweeper families (or say about 300 persons), the income per family per month varying from two annas three pies up to Rs. 21-7-2, plus chuppaties, etc., in kind. Many of the poorer houses employ no sweeper at all, and there is little doubt that householders are as apt to shirk their payments to the sweepers as the latter are to shirk their work. The sweepers live far from their work on the outskirts of the city. At present the smaller streets and back premises in the city are very much neglected, and I have received many complaints during my inspections. I regard the present system as impossible of control by any staff of Inspectors or conservancy peons.

"A sweeper has occasionally been prosecuted, with the result that the Honorary Magistrate either acquits him or imposes a nominal fine, which is too readily paid. The householders, who keep their premises filthy and neglect their debts to the sweepers, are rarely, I might say never, prosecuted, and get off scot-free.

"It is only just to the conservancy staff to add that, since the opening of the tramway in 1886, more scavenging has been done. The Birat sweepers take their loads in baskets or on bullocks to the collecting station of the tramway, and there deposit them into the wagons. As a register is kept of the wagons filled, and no night soil is allowed to go elsewhere, there is thus a rough check upon collection. Baskets and bullocks are not good of means of carriage, but most of the streets are so steep, narrow and irregular, that no other

The Birat system prevails in the great native capitals throughout Rajputana, and presents similar advantages and disadvantages.—T. H. H.

way seems possible. It is very desirable that as the city extends towards and in the * Kaisargani, the Birat system should be either discontinued or regulated. Without the city there are about 100 sweepers, partly Birat and partly private men, who are paid by house and hut residents. I would suggest that the matter be thoroughly investigated, with a view to effecting a redistribution of the "Birats" and placing the men directly under the control of the municipality. Nothing short of this will be of any use. Payment might be made by the persons benefited as before, but if this cannot be reasonably controlled and enforced, so as to do justice to the sweeper class, it will be necessary for the municipality to take over the entire staff. This may or may not involve the purchase of the "Birats" and their redistribution by resale in workable divisions. A fair charge could be realised from owners of private latrines and cesspools, who would pay for their privilege. A small tax, averaging Rs. 2 per year per latrine and cesspool (or three annas a month), would more than suffice. With the present unreasonable system, neither the owners of house nor the sweepers can justly be called to account or controlled. The disposal of night-soil from the city, suburbs and railway is carried out through the agency of the new conservancy tramway with the following exceptions:-

- 1. Aimere jail to do their own trenching near the jail.
- 2. Merwara Battalion Lines to do their own trenching near the Lines.
- 3. Mayo College Park to do their own trenching near the Park.
- 4. The 1,600 to 2,000 huts near the railway and in the valley have no conservancy arrangements.

The chief advantages of the tramway system are:-

- (a) The night-soil is removed to one place, at a safe distance from the city and valley.
- (b) The collection being at one place, the total daily work done is known, and easily supervised.
- (c) It is prompt and cleanly.
- (d) The trenching ground will eventually become a valuable property.

"Carts bring their loads in a removable body to the collecting station, where the body is transferred to the wagon frames on the tramway. Birat sweepers and bullocks also bring their loads direct to the tramway wagons. Trains of nine wagons each are taken down the line to the trenching ground by one pair of bullocks; the 'bodies' of the wagons are tipped into trenches, and the wagons returned to the collecting station by the same bullock power. Each wagon receptacle contains 18 to 20 cubic feet of stuff. With the present system of basket and bullock removal of night-soil from otherwise inaccessible premises in the city, it is unavoidable that a very great deal more material has to be carried by the tramway than would be the case if carts could traverse the streets and be filled direct. Ashes and sweepings are necessary to render this method of carriage possible, and probably three or four times the actual quantity of night-soil has to be

20782.

removed. This probably is counterbalanced by the lessened quantity of liquid carried away, as by the absence of urinal accommodation, and the wretched condition of private latrines and cesspools, a large residue goes into the soil of the town. The quantity is, however, increased by bathing and washing water. At present 1,350 cubic feet of solid and 900 cubic feet of liquids are daily carried away by the tramway. This compares favourably with the old cart system, when some 60 carts only were employed, and did perhaps half of this work without removing the night-soil to a safe distance from the City. The tramway has now been at work without intermission for nearly two years, and has never failed in its work. For some time the work increased, necessitating extra carts and rolling stock. The present daily average of 125 wagon loads was reached about eight months ago. A few more wagons under frames are required to facilitate removal to the trenching ground. For removal to the trenching ground by the tramway system, the residents in private houses in the suburbs pay 5 per cent. on their rental, in addition to their private sweeper establishment. The house owners of the city get the tramway for nothing; they only pay for their private arrangements of Birat sweepers for collection. Many persons, perhaps one-half of the town, pay nothing whatever for either collection or disposal."

The following is the conservancy staff employed by the municipality (1896): -

- 1 Inspector.
- 2 Sub-Inspectors—1 for City and 1 for the Suburbs and Railway.
- 4 Jemadars-2 for the City and 2 for the Suburbs and Railway.
- 20 Peons—2 of whom feed conservancy bullocks, 3 are orderly peons and 15 look after a staff of 581 sweepers, viz., 500 Birat and 81 Municipal.
- 81 Sweepers—58 for 34 public latrines, 12 for urinals and 11 for roads.
- 5 Bhishties—4 of whom supply water for washing out the latrines and urinals, and 1 for watering the bullocks.
- 37 Cartmen—of whom 22 are for the public latrines and urinals and for private houses and 15 for road sweepings.

Since Mr. Joscelyne's notes were written in 1888, the following sanitary improvements have been carried out:—

- 1. The City moat has been entirely filled in with earth, road sweepings, etc., and is being planted with trees.
- 2. The Masuda tank is being filled up with road sweepings, and the work will be completed in about two years.
 - 3. The Malusar tank water is not now used for drinking water.
 - 4. The Lungia tank is now drained and the tank is not allowed to store water.
- 5. The public urinals have been increased from 17 to 38 in the city, and from 3 to 6 in the suburbs, but more are still required.

The public latrines are as before. Since Mr. Joscelyne drew up his notes, private latrines in the city and suburbs have been much improved. All new latrines are better designed and built. No register is kept to show the exact number of latrines.

6. A large number of small cesspools have been removed, and no new cesspool is now permitted under the wall drain pipes below the ground level.

All sullage and liquid sewage is now collected in tubs or iron vessels placed under the drain pipes and the ground polluted as little as possible.

Earthen and tin pipes are discouraged, and iron drainage wall pipes substituted.

- 7. All tanneries have been removed outside the city.
- 8. Portions of the city wall have fallen and have not been replaced; other portions have been removed.
 - q. Many large collections of huts have been removed, and new colonies discouraged.
- 10. The Birat system is given up in some mobullas and the scavenging is done by the municipality, an arrangement which has given great satisfaction.
- 11. The introduction of drinking water from a distance from the Foy Sagar, in 1892, by pipes to all the principal streets, and to many private houses, is also intimately connected with late sanitary improvements.

If a comprehensive system of city conservancy could be instituted, which would bring every sweeper, "Birat" or other, directly under the municipality, great good would ensue; and no other plan will be successful which does not place all sweepers entirely under efficient supervision and control.

SLAUGHTER-HOUSES.

There is only one slaughter-house for sheep and goats, and this is outside the city near the Delhi Gate. The slaughter-house is under the supervision of an Inspector.

There is a prohibition against killing beef in Ajmere. It can be got from Nasirabad, where it is provided for the English regiment stationed there.

MARKET'S AND FOOD.

Meat is sold in many of the main streets of the city and suburbs, and in the Kaisar Ganj division is a properly built meat market. It is proposed to build another market in Cavendishpura.

There is no proper fruit and vegetable market in the city, vendors using the streets for selling these articles of food. There are shops constituting a sort of market near the Madar Gate. A properly built vegetable and fruit market would be a great benefit to the city, and the municipality have proposals under consideration for building a suitable market.

Grain is sold all over the city in small shops, and the great market for grain of all kinds is the Dhan Mundi.

The following table shows the average prices of food-grains sold in Ajmere from 1818 to 1895:—

Price of food-grain in Ajmere from 1818 to 1895.

LIGHTING AND DISPOSAL OF THE DEAD.

LIGHTING.

All the principal streets, lanes, and roads of the city and suburbs are lighted by oil lamps. There are about 400 lamps in all.

DISPOSAL OF THE DEAD.

There are two grave-yards for Europeans, Eurasians and Native Christians. They are some distance from the city and habitations, and are under the supervision of the Chaplain-The Muhmamadan grave-yards are on all sides of the city; most of them are close to the inhabited portions of the city, and are very objectionable. The question of removal to other and more favourable sites is taken up by the municipality on every available opportunity. The burning-places of the Hindus are at Unda Bala near the Somalpore road to the south of the city, and the other is at Lungia near the Pushkar road. These places are well situated.

SANITARY IMPROVEMENTS IN AJMERE CITY.

Between 1870 and 1880 repeated and continued attempts were made to secure a satisfactory disposal of city refuse, which at first was simply buried in pits at different times (the exact date not being available). Trenching was tried, and the removal of sewage to a distance, where it was stocked and covered with a thick layer of earth, in the expectation that after a time it would be purchased, when desiccated, by gardeners. These plans having failed for various reasons, it became necessary, as the only means by which to meet the difficulty of keeping the continually enlarging city clean, to provide a tramway service for

the removal of sewage. Before the actual construction of the tramway some changes were made which require notice, viz.:—

In 1883, the Bisla Tank, which was considered to be the cause of a large area of swampy marsh in the middle of the station, and to prevent thorough drainage, was abolished, and a arge reduction in the number of cases of malarious fevers followed. In this year a scheme to supply the city with filtered water from the Ana Sagar lake, distributed by pipes, having been adopted, the necessary works were begun.

In 1885, the laying of a tramway from the city to a trenching ground three miles distant was commenced.

In 1886, the tramway, having been completed, was brought into use, and has since worked very successfully.

In 1887, the washing of clothes in the Ana Sagar lake having been prohibited, ghats and tanks for the use of the washermen were erected at a distance and connected by pipes with the Ana Sagar lake.

In 1888, all tanneries which existed within the city walls were removed to a position outside, and no offensive trades are now permitted inside the town.

In 1889, to obviate the nuisance and danger resulting from the common use of masonry cesspools existing in nearly every house, the use of these was proscribed, and the substitution of removable iron receptacles ordered, and in a very large proportion of cases effected.

In this year the water-supply works were finished and brought into operation.

In 1890, the city latrines were reconstructed on improved principles, and a number of huts existing under insanitary conditions were removed.

In 1891, the Foy Sagar scheme, to still further secure a larger supply of purer water, was sanctioned, and was afterwards completed, and is now the main source of water-supply to the city. A plan for the erection of model quarters for a large number of work-people was passed.

In 1892, filth carts were not allowed to traverse the main roads. The main drains of Kaisar Ganj were paved for half their length.

In 1893, the system of removing foul water in earthen "gharas" carried by sweepers, instead of by the conservancy carts passing through the city, was introduced and worked satisfactorily. All privies in private houses at Taragarh were improved. Public drains in Kaisarganj and part of the Naya Bazar drains were paved and made on an improved design. Many old huts situated on the Nasirabad road were demolished and no new huts are now allowed to be erected there.

The Jail and the Merwara Battalion were supplied with water from the Foy Sagar by means of pipes.

In 1894, the system of throwing into the streets the waste water of cisterns attached to the hydrants in narrow streets of the city was discontinued, and arrangements were made to cart the water outside the city.

• The slaughter-house outside the Delhi Gate, which was very insanitary, was reconstructed and made sanitary.

The city moat was filled up and the ground is now planted with trees. About fifty old huts on the Nasirabad road were removed.

In 1895, an improved pattern of cart was provided by the municipality for the removal of foul water from the city, which proved useful.

Owing to the opening of a new General Hospital near the Government Telegraph Office, a new road from the City Branch School to the Telegraph Office was made. The road is of great use to the city people going to and from the Railway Station, as well as opening up an overcrowded part of the city.

One new iron latrine was erected outside the Madar Gate, and one iron urinal was substituted in place of a masonry one.

It may be added that of late every endeavour has been made to keep the city clean, to fill up old pits and all old graves, and a strict watch is maintained on the working of the sanitary system.

It will be seen from the statistics which follow, that as regards fevers, bowel diseases (dysentery and diarrhoa) and cholera, a very marked diminution of disease has ensued which may justly be attributed in a great measure to the above-mentioned sanitary measures. The population of the city and suburbs has increased to a remarkable extent during the last twenty-five years. In round numbers the population, excluding the Jail, Regiment, and Mayo College, was 26,000 in 1871; in 1881 it had risen to 48,500, and in the early months of 1891 it was found to be 66,000. Bearing these facts in mind, there is shown a marked diminution in the incidence of the diseases mentioned, and this is most strikingly evident within the last ten years, during which improved sanitary conditions have been enjoyed.

Again, the number of deaths, calculated in ratio to population has of late years, and since sanitary improvements have been effected, shown a striking decline, and the diminution must in fact have been much greater than that indicated, as it was not possible to take into account, when working out the averages, the persistent yearly increase in the number of inhabitants.

For the first ten years the ratio refers to a population of 26,000 only, but during the lapse of that period it was constantly augmenting, so as to reach in 1881 a total of 48,500, and for the following decade the yearly difference was even greater, as the census taken in 1891 shows the population to be in that year 66,000. The true averages, therefore, must be much below those given.

The construction of the Rajputana Railway in the first instance, and the erection of large central workshops in Ajmere afterwards, have been the main factors in causing the enormously increased population above referred to. They were both fully operative in 1879, and the statistics furnished fairly prove that not only have the increased needs of a population, almost trebled in 20 years, been successfully met, but that, moreover, the general health is now much better than it was in the earlier years of the period above noted. Diminution of disease and a lowering of the death-rate averages have, in Ajmere, followed closely on the provision of an improved sanitary system, to which it is not unreasonable to attribute such good results.

METEOROLOGY.

The following tables give all the information relating to the Meteorology of Ajmere since 1866. The observations given prior to 1880 were made in the Ajmere Jail, and, though correctly recorded, were probably defective for various reasons which were unavoidable, those since 1880 were made by a capable Government Observer, under proper conditions, and are correct. I am indebted to the kindness of the Meteorological Reporter to the Government of India for nearly all the following statistics, which were prepared in his office, a fact sufficient to youch for their accuracy.

List of instruments that are in use at the Ajmere Observatory.

- 1. Barometer.
- 2. Attached Thermometer.
- 3. Dry-bulb Hygrometer.
- 4. Wet bulb do.
- 5. Dry Minimum Thermometer for shade.
- 6. Wet Minimum Thermometer for shade.
- 7. Maximum ,, ,,
- 8. Rain-gauge (top of funnel 5 inches diameter).
- o. Anemometer.
- 10. Wind Vane.
- 11. Sand Glass.

This Observatory is a 2nd class Observatory, and was established in 1866. Its present site was selected in January 1880, previous to which observations were made at the Central Jail.

The statement showing the monthly and annual rainfall in Ajmere, for the years 1866 to 1895 gives an idea of the precarious and partial rainfall of the Ajmere Valley. Mr. La Touche in his report on the Settlement of Ajmere-Merwara districts, 1875, writes as follows on the rainfall of Ajmere:—

"The province is on the border of what may be fairly called the Arid Zone, and is the debatable land between the north-eastern and south-western monsoons and beyond the full influence of either. The south-west monsoons sweep up the Nerbadda Valley from Bombay, and, crossing the tableland at Neemuch, give copious supplies to Malwa, Jhallawar and Kotah, and the countries which lie in the course of the Chambal river. The clouds which strike Kattywar and Cutch are deprived of a great deal of their moisture by the influence of the hills in those countries, and the greater part of the remainder is deposited upon Abu and the higher slopes of the Aravalli, leaving but little for Merwara, where the hills are lower, and still less for Ajmere. It is only when this monsoon is in considerable force that Merwara gets a plentiful supply from it, and it is only the heaviest storms which get as far as Jodhpore, where the average rainfall does not exceed 13 or 14 inches, while beyond this is the rainless land of Scinde. The north-western monsoon sweeps up the valley of the Ganges from the Bay of Bengal and waters the northern part of Rajputana, but hardly penetrates further west than the longitude of Ajmere; on the conflicting strength of these two monsoons the rainfall of the district depends.

"The prevailing wind during the rainy season is a south-westerly one, but there is but little rain which comes from this direction. The south-west monsoon is exhausted before it reaches even Merwara, and if this monsoon is in the ascendant, the weather will be cloudy and there will be light and partial showers, but no heavy rain. When the wind veers round to the west there will be no rain; it is from the north-east that Ajmere, Beawar and Todgarh obtain their heaviest rainfalls, though the south-western monsoon has naturally more effect at Todgarh than at Ajmere. The central portions of the province often receive heavy falls from the north-west, the north-east monsoon being apparently diverted from its course by the winds from the desert.

"The direction of the wind is most changeable, and the rainfall is exceedingly partial.

"Not only, however, is the rainfall most precarious and partial, varying in total amount very much from year to year and from place to place, and falling with fury on one side of a hill while the other side is perfectly dry, but it is most irregularly distributed over the rainy season, and most uncertain as to the intensity of the fall; this last question is a most important one with reference to the filling of the reservoirs. If the rainfall is in light showers, even though it be on the whole an average fall, the soil will absorb it, the nullahs will not run, and the tanks will remain empty. If the fall is sudden and heavy and at the same time general within the catchment area of a tank, the chances are that the embankment will be damaged. The best rainy season is one which includes a fall of 3 or 4 inches in the 24 hours in June, and a similar fall in September, with intermediate showers. Then the tanks fill and are replenished for the rabbi harvest and the kharif crop is not drowned with excessive rain."*

These peculiarities may be illustrated from the history of the years for which records have been kept.

In 1860, the rainy season was a bad one, the tanks were unfilled, and no rain fell in September; 10.77 inches fell. The north-cast monsoon failed in the North-Western Provinces, and Marwar got more than its usual rain from the south-west and so averted a famine. 1862 was a year of extraordinarily heavy fall; 43.40 inches fell. The rainfall was spread over a long period, and the tanks were filled but not destroyed.

In 1864, there was an average fall, but it ended before the second week in August.

In 1865, there was no rain until the middle of August, and it ceased entirely in the second week of September, only 1'18 inches being registered for that month. The tanks were filled.

In 1866, there was not much rain before August, when 19'90 inches fell, and 26'02 inches fell in the year. 1867 was a favourable year, and in the next eyear, 1868, only 9'32 inches fell in Ajmere, and an average of 7'4 for all stations, and there was famine.

In 1869, 23'92 inches fell, but no rain fell till the middle of July, and then there were long breaks with little rain till September, when 14'60 inches fell.

In 1870, only 16.97 inches fell, but was well distributed.

^{*}A full account of the meteorology of Rajputana by Mr. Eliot, Meteorological Reporter to the Government of India, will also be given in the Provincial Medical History.—T. H. H.

In 1871, there were 8 inches in June and 5 inches in August, in all 21'75 inches. 1872 was a good year, 32 inches fell and were well distributed. 1873 and 1874 were fairly good years, with well distributed rain. 1875 had a large rainfall, 36'37 inches, the greater part of which, vis., 17'80, fell in September. 1876 was a good year, with 24'09 inches. 1877 was remarkable in that rain fell in every month of the year, and only 11'67 for the whole year, July got 4'23 inches and no other month got 2 inches.

1878 was a good year with 31.05 inches, of which 10.06 fell in July and 15.32 in August, and only 1.17 in September. From 1879 to 1885 were good years, with rain from June to September.

In 1886, 15'34 inches fell, which was distributed between May and October. From 1887 to 1889 good rain fell.

In 1890, 14:55 inches fell, giving only small amounts to each month of the rainy season.

In 1891, only 8'93 inches fell, in July 3'77 inches fell, in August and September a little over an inch, and in all the other months less than an inch. This year was a tir-kal or triple famine, of water, fodder and grain. Fortunately 1892, 1893, 1894 and 1895 were progressively good years.

The average rainfall for Ajmere for the 30 years, 1866-1895, was 22.62 inches.

Statement showing monthly and annual rain fall at Ajmere from 1866 to 1895.

readings (10 h. minus 16 tons). In this case the lowest range is shown by a negative value. The reason is that the 16th after a storm centre passed ever the station on the morning of that date.

CLIMATE.

Theclimate of the Ajmere District is dry and healthy.

In the hot season strong hot west winds prevail, alternating with easterly breezes; the hot south-west wind is the most prevalent, and this wind is used by those houses in which grass tatties are placed to reduce the temperature. This wind blows sometimes for weeks together day and night, and the temperature of houses can be kept down to somewhere near 80° Farenheit by means of tatties. A large number of the inhabitants of Ajmere, both European and Native, sleep outside on the ground or on their houses during the hot season and the nights are, as a rule, cool and refreshing, though the constant wind is troublesome. This is the healthiest season of the year. During the rains a south-westerly or North-Easterly wind is nearly always blowing according as either monsoon is in the ascendant. At the beginning of the rains and just before the first good fall of rain, the climate of Ajmere is most trying and disagreeable, but after the rains are fairly set fn, the wet season is pleasant. During the autumn following the rains the air becomes dry and unpleasant, and malarial fevers become prevalent; they are not, however, of a severe or fatal type. The weather in December, January and February, when hoar frost not unfrequently covers the ground, is cold and bracing, and the cold at times is severe.

The climate of Ajmere is healthy and is favourable for Europeans, especially for European children, who appear to suffer less from those diseases incidental to infancy and childhood than the children of many other parts of India, and whose illnesses, when they occur, are of a mild type and chiefly to be traced to errors in diet.

HOSPITALS AND DISPENSARIES.

The first charitable public dispensary was opened in Ajmere on the 15th January 1851. The idea of starting a charitable dispensary in Ajmere was originated by Colonel Dixon. It was constructed at a cost of Rs. 6,000, from funds subscribed by the citizens of Ajmere, and the building was constructed near the Agra gate inside the city, affording accommodation for 25 beds—21 for males and 4 for females. This dispensary remained constantly open from 1851 to 1895; when the new General Hospital was completed. A great deal of medical and surgical aid was rendered to the citizens of Ajmere and to the district of Ajmere-Merwara and to people from other parts of Rajputana and India in the old dispensary; but for some years previous to 1895 the old dispensary was found to be increasingly inadequate to the demands made upon its accommodation for in-door sick, for operations and for general hospital work; there were also no proper quarters for the hospital staff.

In 1895 a modern and more suitable hospital was built outside the city walls at a cost of Rs. 43,000. The old dispensary was vacated and the new hospital occupied in December 1895. The new hospital was built from funds liberally subscribed by some of the wealthy citizens of Ajmere, by the Municipality, and from the amount realized by the sale of the old dispensary.

The new hospital is a fine building containing several large wards, and is built in accordance with modern hospital requirements. It gives accommodation for 55 beds, vis.,

33 for males, 10 for females and 12 for men of the Ajmere Police. The old Police Hospital, which was for many years in the Magazine, was abolished when wards in the new General Hospital were made available for the police sick.

The present staff of the General Hospital is quite inadequate for the amount of work which is now done in the institution; there is a daily average of 17.84 in-patients and 105.23 out-door patients treated at this hospital. In 1895 there were 197 major operations, and for the ten months of this year 1896, 250 major operations have been performed. It has not been found that the General Hospital work has fallen off since the hospital has been removed to a site outside the city, and there is no doubt but that the greater accommodation, and better site and surroundings will, as time goes on, increase the usefulness of this institution.

The hospital buildings are complete, but the ground belonging to the hospital is only partially enclosed. The buildings and ground urgently require a surrounding wall with gates.*

RAILWAY HOSPITAL AND DISPENSARY.

There is a large Central Railway Hospital and a Railway Branch Dispensary in Ajmere. The former is a fine building near the Railway Workshops and has wards for European and Native patients as well as a female ward. This hospital has accommodation for 24 beds, i. e., 12 for Natives, 6 for Europeans (male), and 6 for Europeans (female). The Branch Dispensary is near Cantonments and is very useful for Railway officials and their servants as the distance of most of the houses of Railway officials from the main hospital is great. The Central Hospital is well equipped with instruments and hospital appliances, and is liberally stocked with medicines from Bombay; when it is remembered that over ten thousand individuals are more or less dependent on the Railway and that all these people can obtain medicine and advice at the hospital or dispensary, some idea of the amount of work and usefulness of these institutions can be formed.

During 1895 the numbers of out-patients attending the Railway Hospital were as follows:—Europeans 568, Eurasians 1,223, Natives 7,358; 6 Europeans, 5 Eurasians, and 169 Natives were treated as in-patients, and 372 visits were made to the houses of sick Railway servants.

PRESBYTERIAN MISSION HOSPITAL.

In 1872 the Rajputana United Presbyterian Mission opened a dispensary in the city under the charge of the Revd. Dr. J. Husband. In 1896 a new building was constructed by the Mission, from funds collected in Scotland. This new hospital is near the Delhi gate of the city and has accommodation for 20 beds. Nearly 21,000 new cases were treated as out-patients in the Mission Dispensary in 1895, and 135 in-patients were admitted during the year. The cost of maintenance, wages and medicines, etc., for 1895 was Rs. 2,253.

BRANCH DISPENSARIES.

There are four Branch Dispensaries in the Ajmere District, viz., Kekri, Pisangan, Ramsar and Deolia.

^{*} Many minor improvements are required in order to make this hospital perfect. Unfortunately, funds are not at present available —T. H. H.

KEKRI.

The population of Kekri is 7,100. This small town is increasing as a market, and the small Tejaji Fair is becoming a recognised commercial as well as religious institution. The number of occupied houses is 1,353.

Kekri is 50 miles from Ajmere.

The dispensary was opened on 7th July 1869. The number of patients treated during 1895 was 5,753, i.e., 44 in and 5,709 out-door, and the cost of the dispensary for the year was Rs. 797. The daily average attendance of in and out-door patients was 1.44 and 34.69 respectively. There is a Deputy Magistrate at Kekri, who is also Chairman of the Municipal Committee.

PISANGAN.

Is a small town, owned by a Rajput Istimrardar, with a population of 5,521. It is 12 miles from Mangliawas Railway Station and 28 miles from Ajmere. The dispensary was opened on 6th August 1869. The number of out-door patients treated during 1895 was 3,277, with a daily average attendance of 26.81, and the annual cost was Rs. 478.

There is no accommodation for in-patients in this dispensary.

RAMSAR.

The population of Ramsar is 3542. Ramsar is to miles from Nasirabad Railway Station and 25 miles from Ajmere. The dispensary was opened on 17th September 1869, and the number of patients treated during 1895 was 3,220, with a daily average attendance of 24'45. The annual cost amounted to Rs. 636.

There is no accommodation for in-patients.

DEOLIA.

Deolia has a population of 3,748 and is owned by a Rajput Istimrardar, who pays a quit rent to Government. Deolia is 52 miles from Ajmere and 11 miles from Barl Railway Station. The dispensary was opened on 17th December 1890, and the number of patients treated during 1895 was 3,107, with a daily average attendance of 30.43. The annual cost amounted to Rs. 601.

There is no accommodation for in-patients.

MAJOR SURGICAL OPERATIONS.

The following summary of major surgical operations done in the Ajmere Dispensary is for the 20 years, 1876 to 1895:—

Two thousand and seventy-seven major surgical operations were performed in the Ajmere Dispensary during 20 years, from 1876 to 1895. The highest number, viz., 197, was in 1895 and the lowest viz., 19, in 1876.

REMOVAL OF TUMOURS.— Two hundred and twenty-six operations were performed for tumours, of which 17 were cancers. Of this number five were cancer of breast, two of the eyebrow, and the rest on other parts of the body. Of operations on tumours those for cancer were the least frequent.

LARGE ABSCESS.—Large and deep seated abscesses were opened in 99 cases only.

EYE OPERATIONS.—Seven hundred and sixty-two operations were performed for eye diseases, of which 544 were extraction of lens for cataract, 88 for iridectomies preliminary to cataract operations, and 66 iridectomies for opacity of cornea and glaucoma. In 1895 the largest number of lenses were extracted, viz., 64, and of the 88 iridectomies performed as preliminary to cataract operation, 66 were performed in 1895.

OPERATIONS ON THE EAR.—Only 7 operations on the ear were performed during 20 years, viz., 5 for the extraction of foreign bodies and polypus of the ear.

OPERATIONS ON THE NOSE.—There were 21 operations performed under this head of which 10 were for restoration of the nose; the rest were not very important ones.

OPERATIONS ON OTHER PARTS OF THE HEAD AND FACE INCLUDING MOUTH.—This heading gives only two cases of harelip.

OPERATIONS ON ARTERIES.—Ligature of the femoral artery for lacerated wound of the thigh was done in 3 cases only.

OPERATIONS ON THE DIGESTIVE ORGANS.—Seventy-six operations were performed, out of which paracentesis of the abdomen for ascites was performed in 63 cases, 7 persons were operated on for fistula in ano, and 3 each for hæmorrhoids and imperforate anus. Under this head ascites was the most common cause for operation.

OPERATIONS FOR HERNIA.—Seven persons suffering from strangulated hernia were operated on during the 20 years.

OPERATIONS ON THE URINARY ORGANS.—One hundred and ninety-five persons were operated on for diseases under this head, of which operations for stone were done in 177 cases. Perineal section was done in 6 cases for stricture of the urethra, and in 3 cases for perineal fistula.

Internal urethrotomy was performed in 6 cases, and external urethrotomy in one case, and paracentesis of the bladder through the rectum was done in 2 cases for retention of urine.

OPERATIONS ON THE MALE GENERATIVE ORGANS.—The penis was amputated for cancer in 9 cases during 20 years, 3 cases came for hypospadias, in which a new urethra was formed, one in 1882, and two in 1885.

Nineteen operations were performed for hydrocele, vis., 9 in 1893, 5 in 1894, 3 in 1877, and one each in 1876 and 1886.

OPERATIONS ON THE FEMALE GENERATIVE ORGANS.—Twenty-four operations were performed under this head, viz., 2 for imperforate vagina, 1 for recto-vaginal fistula with abscess of anus, 1 for arm presentation, 10 for fœtal remains and 10 for difficult labour.

OPERATIONS ON BONES AND JOINTS.—Operations or setting fractures were done in 109 cases, and 295 dislocations of different joints were reduced; 35 cases were operated on for necrosis of bones.

OPERATIONS ON LIMBS. AMPUTATIONS—One hundred and seventy-five amputations of limbs were done in 20 years, of which legs were amputated in 66 cases, fingers and toes in 53, foot in 24 cases, arm in 20 cases, and thigh in 12 cases, mostly for mycetoma and gangrene.

MEDICAL CASES.

SMALL-POX.—From 1876 to 1895 the small-pox cases, which attended the Ajmere Charitable Despensary, numbered 153 only, and the number of deaths registered in the city from this disease was 799, giving a yearly average of 39.95 deaths.

The years 1884 and 1886 were the most fatal, next to which were the years 1887, 1892, 1885, 1883, and 1891 respectively. Very few cases of small-pox are treated at the dispensaries. Owing to religious prejudices people do not like to undergo medical treatment for this disease. Before the introduction of vaccination, this disease was very prevalent in epidemic form, and the people generally objected strongly to vaccination. But of late years vaccination operations have increased very much both in the city and the district. Many people in the city are now well acquainted with the advantages of vaccination, and do not oppose it as much as was done previously. Since 1895, the Vaccination Act has been made compulsory in Ajmere City.

The following is taken from Dr. Irvine's book on the General and Medical Topography of Ajmere, published in 1841, page 115:—

"Small-pox often becomes epidemic in the district, and is exceedingly severe and fatal especially at Ajmere; it generally appears about the beginning of the hot weather, is most severe when the weather is the hottest, and declines as the rains advance. Every fourth or fifth year the disease breaks out more severely, becoming a dreadful scourge, so much so, as to be a great check on the population."

Dr. Irvine used every effort to introduce and keep up vaccination, but found it almost impossible to keep up a supply of fresh lymph owing to the prejudice of the people against vaccination.

At page 116 of his book Dr. Irvine writes:-

- "Last season (1840), in Ajmere alone 1,900 children died of this scourge. The ravages of the disease are visible in almost every face met with, and the number of wholly blind and one-eyed people from this cause is very great," and at page 154:—
 - "The small-pox has the greatest effect in depressing longevity by carrying off thousands

both in infancy, and from eight to twenty-two years of age; to this latter cause the small population may be mainly attributed."

DYSENTERY.—Seven hundred and seventy-five cases of dysentery were treated in the Ajmere Dispensary in 20 years, or an average of 353 per annum. Most of them occurred in August, and the least in February.

MALARIAL FEVER.—Forty-three thousand seven hundred and sixty-seven cases were treated in the Ajmere Dispensary from 1876 to 1895, or an average of 2186 36 per annum. Most of the cases attended the Dispensary in October and November, and the least in February and June. Fever generally prevails as soon as the rainy season is over. During 20 years, 12,560 deaths from fever were registered in Ajmere, giving an average of 628 deaths per annum. The year 1895 was the most fatal, and 1887 the least.

When fever occurs to any extent in the district, fever pills are distributed in the affected villages through the District Superintendent of Police.

SYPHILIS.—Nine thousand one hundred and fifty-two persons were treated for syphilitic affections during 20 years with a percentage of 2.52 cases among the total number of persons treated in the Dispensary from 1876 to 1895. Most of the cases came for medical treatment during June.

GONORRHEA.—Gonorrheal diseases accounted for 7,676 persons who came for medical aid.

WORMS.—Persons suffering from intestinal worms numbered 3,526, or an average of 176 per annum.

DEBILITY.—Debility caused an admission of 1,738 cases during 20 years.

RHEUMATISM.—Rheumatic affections were very common in April, May, June and July and the persons treated for this disease during the 20 years numbered 14,530.

TUBERCULAR AFFECTIONS.—Tubercular affections caused an admission of 1,769 cases with an annual average of 884.5 cases. They were mostly seen in March and August.

LEPROSY.—In 20 years, 731 persons were treated for leprosy. This disease is not very common in Ajmere.

EYE DISEASES.—The diseases under this head gave 26,632 cases. Most of the cases of eye disease occurred in April, August and September. They are very common among children and young men.

DISEASES OF THE EAR.—Otorrhœa caused 16,935 admissions, of which the largest number was treated in August, and the least in February. The average admission per annum for diseases of the ear is 846.

DISEASES OF THE CIRCULATORY SYSTEM.—There were altogether 1,642 persons treated for these complaints. Most of the cases received treatment in June and September, and then from January to March.

CARDIAC DISEASES.—Are not very common.

DISEASES OF THE RESPIRATORY SYSTEM.—The months of November, December, January, February and March brought the largest number of such cases. They are common in the winter season.

PNEUMONIA.—Caused the highest admissions, but not in an epidemic form.

DIARRHŒA.—Seven thousand six hundred and ninety-six persons were treated for diarrhœa; the largest number was admitted in August, and the least in February.

DISEASES OF THE LIVER.—Liver diseases caused an admission of 1,133 cases only, with a percentage of .31 only among the total number of patients treated for all diseases from 1876 to 1895.

GOITRE.—Goitre is most rare, only 6 cases attented the Dispensary during 20 years.

DISEASES OF THE SPLEEN.—Splenic complaints caused an admission of 3,358 cases. Most of the cases were admitted in January, June, July and October.

DISEASES OF THE GENERATIVE SYSTEM.—Diseases under this head brought 1,097 cases for treatment.

DISEASES OF THE CONNECTIVE TISSUE.—34,379 persons were treated, with an annual average of 1,719 cases.

DISEASES OF THE SKIN.—Skin diseases caused an admission of 34,762 cases, with a percentage of 9.56 among the total number of patients treated during 20 years, the average annual admission being 1,738.

ULCERS.—Medical aid was given to 38,461 sufferers from ulcers during 20 years, the percentage to other diseases being 10.57. People generally suffer from ulcers during the rainy season in Ajmere.

Mortality Table, Ajmere City, 1876 to 1895.

HEALTH OF EACH MONTH.

JANUARY.—This month stands third in point of death-rate and eleventh in prevalence of diseases. Amongst the patients who attended the dispensary for different complaints, ulcers and diseases of the respiratory system were most common, followed by malarial fever. The month is the coldest in the year.

FEBRUARY.—February comes eleventh with respect to mortality and twelvth in point of prevalence of sickness. Respiratory affections are a little less than in January. Skin diseases give the largest admissions amongst the total number of patients treated in the dispensary, during this month. Fever, dysentery and diarrhœa are less than in last month.

MARCH.—March is the least fatal month, and as regards sickness it stands ninth.

Skin diseases and fevers are most common in this month, in proportion to the total number of patients treated for all diseases.

APRIL—Is ninth in order of mortality and eighth in point of sickness. Skin diseases give the highest rate of attendance, next to which stand diseases of the eye, followed by fever.

MAY.—May is fourth in the frequency of mortality and sixth in sickness.

Fever, eye diseases, diseases of the skin and ulcers give the largest number of attendances in the dispensary.

JUNE.—This month stands tenth in point of mortality and fifth as regards prevalence of diseases.

It comes eleventh with respect to the prevalence of malaria, skin diseases and ulcers, and diseases of the connective tissue which cause high rates of attendance.

JULY—Comes eighth in regard to mortality and fourth in point of sickness.

Rheumatism was less frequent than in the preceding three months, but more general than throughout the rest of the months in the year. Dysentery and diarrhoea gave a higher rate of attendance than in the preceding months.

AUGUST.—August is fourth in point of death-rate, and the most unhealthy month throughout the year in regard to the prevalence of disease.

Ulcers, diseases of the skin, diseases of the connective tissue, eye diseases and fever are general.

SEPTEMBER.—The mortality of this month stands next to August, being seventh, but stands third as regards sickness. Malarial fever is more prevalent than in any of the preceding months, and gives the largest admissions in proportion to the total attendance.

OCTOBER—Comes fifth as regards mortality and second in point of sickness. Fever is more frequent than during the rest of the months throughout the year—it gave the highest number of admissions amongst the total number of patients treated.

Dysentery and diarrhoea were not so frequent,

NOVEMBER.—November is the second most fatal of the months, but stands seventh in point of prevalence of diseases.

With regard to the prevalence of malaria and diseases of the respiratory system, it stands second.

DECEMBER.—December has the highest mortality and stands tenth on the list as regards sickness. Respiratory affections and fever give a larger number of attendance than any other disease.

Monthly Mortality from all Diseases in Ajmere, from 1876 to 1895.

Remarks on the General Health of Ajmere City with Notes on the prevailing Diseases from 1876 to 1895.

1876.—Taking the census figures of 1876, the death-rate for this year was 40.50 per 1,000 of population in Ajmere City.

The city was quite free from cholera, but 148 individuals died from small-pox, 510 from fevers, and 219 from bowel complaints. Rainfall, 24.09 inches.

1877.—This year was very similar to 1876 in regard to the death-rate, which was 41.38 per 1,000, or .88 more than in 1876.

Small-pox was more prevalent than in last year carrying off 314 persons against 148, while deaths from fevers and bowel complaints showed some decrease. Rainfall, 11'76 inches.

- 1878.—This year was very unhealthy, the mortality being 56.77 per 1,000 of population. The high rate of mortality was caused chiefly by fevers—865 deaths were reported from fever, 310 from bowel complaints, 110 from small-pox, and 36 from cholera. Small-pox was much less than in the previous two years. Rainfall, 31.05 inches.
- 1879.—In 1879 the death-rate fell from 56.77 to 45.97. There were 15 fatal cases from cholera and 29 from small-pox, against 15 and 29, respectively, in last year. Malarial fevers were very prevalent as in 1878. Rainfall, 27.5 inches.
- 1880.—The year was healthy, the death-rate being 39.55 or 6.42 less than in last year, and 17.22 less than in 1878. There were no cases of cholera. Small-pox increased much, the fatal cases being 140 against 29 in 1879. Malarial fevers were much less than in the previous year. Rainfall, 18.45 inches.
- 1881.—According to the census of 1881, the population of Ajmere amounted to 49,151 against 31,583 in 1871, and on this calculation the death-rate was only 14.55 per 1,000, which shows the year to be a healthy one. The registration of vital statistics was not altogether reliable; 15 fatal cases from cholera were reported during the year. Small-pox nearly died out; 4 deaths only were reported. Deaths from fever were similar to those in 1880. Rainfall, 21.30 inches.
- 1882.—Deaths from cholera and small-pox increased, but those from fever decreased. The death-rate was only 11.54. Rainfall, 27.24 inches.
- 1883.—According to the figures of registration, the year was most healthy, the death-rate being 9 22 per 1,000.

Deaths from fever decreased from 434 to 295. There was no marked decrease in cholera and small-pox. Rainfall, 1740 inches.

1884.—The death-rate was 24.05 against 9.22 in 1883. There was a marked increase in deaths reported from cholera, fever and bowel complaints, the fatal cases registered being 166, 572 and 220, respectively, against 50,295 and 58, respectively, in last year. Rainfall, 2704 inches.

1885.—The death-rate increased from 24.05 to 27.49. Fatal cases of cholera decreased from 166 to 63, but deaths from small-pox, fevers and bowel complaints increased from 39, 572 and 220, respectively, in 1884 to 192, 616 and 273 during the year. On the whole the number of deaths registered was larger than in the preceding year. Rainfall, 24.77 inches.

1886.—The death-rate shows a great decrease, being 15.04 against 27.49 in 1885. This year small-pox decreased very much; the number of fatal cases reported was 28 against 192 in 1895. Cholera increased to a certain extent, reporting 110 deaths against 63 in last year. Deaths from fevers and bowel complaints also show marked decrease. Rainfall, 15.34 inches.

1887.—The death-rate was 12:00, which shows the year to have been a very healthy one. All the principal causes of deaths show decrease. Rainfall, 21:93 inches.

1888.—The death-rate was much higher than in 1887, being 20'94. An epidemic of small-pox prevailed to a great extent; 167 fatal cases were reported against 3 in the preceding year. Fever and bowel complaints also increased, but cholera was very much less, viz., 13 against 91 in 1887. Rainfall, 24'42 inches.

1889.—The death-rate was the highest since 1881, being 25.84.

Deaths from small-pox and bowel complaints decreased from 167 and 177 to 144 and 137, respectively, but those from cholera and fevers increased from 13 and 497 to 29 and 589, respectively. Rainfall, 25 17 inches.

1890.—The death-rate decreased from 25.84 to 18.47.

Only one death from cholera and seven from small-pox were reported this year, against 29 and 144, respectively, in last year. Rainfall, 14.55 inches.

1891.—According to the census of 1891 the population of Ajmere was estimated at 68,843 against 49,151 in 1881.

The death-rate was 24.80. Small-pox prevailed in an epidemic form accounting for 357 deaths against 7 in 1890. Cholera deaths increased from 1 to 47. Rainfall, 8.93 inches.

1892.—The death-rate rose from 24.80 to 34.80.

Small-pox decreased much; this year there were 198 fatal cases, against 357 in 1891.

Cholera increased from 47 to 861; it was in an epidemic form in June. Out of 86 deaths during the year, 67 occurred in June. Fever also was very prevalent; 1,036 persons died from fever against 684 in 1891. Deaths from bowel complaints were more than double the number in last year. Rainfall, 20.87 inches.

1893.—The death-rate decreased from 34.80 to 22.17.

No cholera cases occurred this year. Fatal cases of small-pox were far less than last year, the figures for 1892 and 1893 being 198 and 34, respectively.

Deaths from bowel complaints were reduced from 469 to 135, and those from fever from 1,036 to 839. The year was very healthy. Rainfall, 32.83 inches.

1894.—The death-rate was 24.77 against 22.17 in 1893.

No cholera cases occurred. Deaths from small-pox increased from 34 to 106. All the other principal diseases show an increase to some extent. Rainfall, 26:99 inches.

1895.—The death-rate shows an increase of 6.87 as compared with last year.

Nineteen fatal cases of cholera occurred this year, while no cases occurred during the last two years. Of these cases, 11 were reported in May and 8 in November. Cases of malarial fever were more numerous than in 1894, the deaths reported being 1132 against 902 last year. Deaths from small-pox increased from 106 to 128. Rainfall, 4:43 inches.

The following table shows the orders of the months as regards conception and birth.—
IN AIMERE CITY.

Order.	Birth:	Order.	Conception.
1 2 3 4 5 6 7 8	November. October. September. August. December. July. January. May. June. March.	1 2 3 4 5 6 7 8 9 10	February. January. December. November. March. October. April. August. September. June.
10 11 12	April. Februâry.	11	July. May.

The above table bears a strong resemblance to a similar table, originally drawn up by Colonel T. H. Hendley, C.I.E., regarding births and conception at Jeypore, and leads one to believe from the constancy and uniformity of the months in the position they are placed in the table, that the above results obtain throughout Rajputana. Dr. Hendley summarises the causes of the above results as follows:—

- 1. Vitality is higher in both males and females in December and January, and in the two months preceding and following those months.
 - 2. In the cold season the food is richer, stronger and more stimulating.
 - 3. Girls are more often sent to their husbands' homes in the winter than at other seasons.
 - 4. Women are less troubled with menstrual disorders in the winter than in the summer.
- 5. The shastras or sacred writings enjoin comparative sexual abstinence during the hot season, and advise that extra and stronger food be used in the winter to build up the strength against the coming hot season.
 - 6. Food is more abundant in the winter; expensive weddings are rare.
- 7. There are several large festivals in the winter in Rajputana at which time fathers and sons make their best endeavour to visit their homes from distant parts where they are engaged in trade.

Birth rate of Ajmere City from 1885 to 1895.

b.-Order of births.

6 .-- Order of months.

CHOLERA.

From the mortality table of cholera from 1876 to 1895 it will be noted that the whole of the Ajmere District was free from cholera in 1894, and there were no cholera cases in the City of Ajmere during 1876, 1877, 1880, 1893 and 1894.

The following is a brief account, of cholera occurring in the Ajmere District since 1876.

- 1876. There were no cholera cases in the City, fifteen deaths were reported from the District, of which 11 occurred in May, 2 in September and one each in April and June.
- 1877. No cases in Ajmere City. Only 1 death reported in the District from the Goela circle during May.
- 1878. There were in all 198 fatal cases, of which 36 were in Ajmere City and the rest 162 from the District. The largest number, viz., 61 occurred in the Sawar circle.

Out of 36 deaths in the city, 17 occurred in September, 15 in August, 2 in July and 1 each in April and May. In the District, July stood first, in which 56 deaths occurred, next to which was September, in which 48 deaths were reported. March was the least fatal, in which only 1 case was noted. January, October, November and December were free from it.

1879. There were 15 deaths in the City, and 120 in the District, total being 135.

Out of 15 deaths in the city, the largest number, vis., 5 reported in April and the least vis., 1 in December. No cases occurred from January to March and from August to November.

In the District the largest number of deaths, vis., 50 was reported in May. No cases were reported in January, March and from September to November.

- 1880. No cases occurred in the City during this year, and only 3 deaths were reported from the District, 1 each during April, May and August.
- 1881. Fifteen cases occurred in the City and one in the District; there were 7 in September, 6 in August, 2 in October and 1 in June.
- 1882. The total number of deaths reported was 281, of which 58 were recorded in the City.

August was the most fatal month.

1883. There were 84 fatal cases, vis., 50 in the City and 34 in the District. In the City, 36 cases were reported in August, 9 in July and 5 in September.

1884. One hundred and sixty-six deaths in the City, 41 in the District; the total number of deaths reported was 207. The disease lasted from May to September, the largest number of cases in one month (128) was in July and the least in May. In the City the number of deaths reported was as follows:—

May	•	•	•	•	•	•	•				. í
June		•	•	•	•	•	•	•		•	• 3
July	_	•	•			_					-
-								•	•	•	• 114
August		•	•	•	•	•	•		•	•	• 43
Septemb	er	•	•	•	•	•	•	•			. 5

1885. Cholera appeared on 3rd April and continued till 31st August, during which period 100 deaths were reported of which 63 occurred in the City. It broke out in the City in travellers who arrived in Ajmere by Railway from Ujjain, where a very severe epidemic of cholera had been raging previously.

1886. In this year 731 deaths occurred, of which 719 were reported in November, in December and one each in April and May. Of the total number reported there were 110 in Ajmere, viz., 107 in November, 1 each in April, May and December.

On the 29th April one fatal case occurred in the person of a Eurasian who lived near the Kaisarganj; the second fatal case occurred on the 23rd May in a Native woman living in the city near the magazine. Ajmere was altogether free from cholera until the opening of the Pushkar Fair, where the disease made its appearance on the 9th November afterwards spreading to the city of Ajmere and its suburbs, and in a few days becoming general throughout the whole district.

1887. Ninety-one deaths in Ajmere and 245 in the District, total being 336.

Out of the 91 deaths in the City, 56 occurred in July, 20 in August, 13 in June, and 2 in September.

Cholera broke out in the City on 14th June and lasted till the 15th September.

In the District the largest numbers of deaths were reported in July, the fatal cases being 106 and the least, viz., 3 in October. The disease lasted from June to October.

1888. In this year only 13 fatal cases, vis., one in April, 9 in August and 3 in September, were reported in the City, the District was altogether free from cholera.

1889. There were 29 deaths in the City and 26 in the District.

Cholera made its first appearance in the city on 7th June and lasted till 26th July.

Three deaths were reported in June and 26 in July.

In the District there were to cases in July and 16 in August.

1890. In the City there were no deaths from cholera with the exception of one in August.

Cholera prevailed in a very severe epidemic form in the District, more especially in Bhinai, Kekri, Sawer and Goella villages where it was rife in June. The disease was imported into Kekri from Sapla, a village in the Kishengarh State, where, in the month of May there had been a Saraogi Fair. The month of June was the most fatal—330 deaths out of 387 occurred in this month in the District.

1891. During this year 532 deaths occurred, of which 47 were reported in the City and 485 in the District. The disease lasted from 2nd June to 12th November, the highest mortality, vis., 202, was in August and the least 5, viz., in November. The largest number of deaths was reported in Srinagar villages and Nasirabad Town, the fatal cases reported being 136 and 123, respectively.

1892. Cholera made its appearance in an epidemic form in the whole District and lasted from April till August. There were altogether 1,835 deaths including those in the City. Of these Bhinai villages gave the largest number, 342. Next to Bhinai the epidemic was unusually severe in Ajmere Rural District, Kekri Rural District, Manglaivas, Ghegal, Sawer, Srinagar and Masuda villages.

Out of 1,835 deaths only 86 occurred in the City and the rest 1,749 in the District. In the City 67 deaths were reported in June, 9 in May, 7 in April, and 3 in July, while in the District the fatal cases reported were 883 in June, 534 in May, 270 in July, 56 in April, and 6 in August. June was the most fatal month during the year, May being the next worse. The first case in Ajmere City was on the 4th April, in a Mussalman, in Kaisarganj; it did not transpire where the man came from. Of 12 cases attacked in April, 5 were travellers. Cases were reported as coming from Patiala, Gangar and Kishengarh. The first case in the City occurred on the 4th April and the last on the 16th July. There were, during this period, 156 cases and 86 deaths.

- 1893. No cases occurred in the city, and 3 deaths were reported in the district, one in April and 2 in May.
 - 1894. This year was altogether free from cholera.
- 1895. Two hundred and eighty-six deaths were reported during this year, of which 19 occurred in the City, vis., 11 in May and 8 in November, and the rest of the 267 deaths occurred in the District, of which 76 were reported in May, 146 in June, 6 in July, and 29 in November. Cholera broke out in May and lasted till July, during which period 249 deaths were reported, vis., 11 in the City and 238 in the District. After the lapse of three months it again made its appearance in November, commencing on the 3rd and lasting till the 30th, during which time 37 deaths were reported, vis., 8 in the City and 29 in the District.

It has been repeatedly noted that cholera does not commence so far as is known *de novo* in Ajmere or in the district, but comes from outside, and the most common sources are large fairs, notably those of Pushkar and Hardwar.

Dr. Irvine, in his book before quoted, at page 119, notes:-

"Common bilious cholera is not unfrequent during the hot season when melons and cucumbers are abundantly consumed, and is generally easily cured."

It is doubtful if this was true cholera, the disease being most probably diarrhea and dyspepsia. Further on he says:—"Spasmodic cholera appears about once every 7 or 8 years in this district, while the neighbouring countries of Kotah and Boondi and Meywar are almost annually liable to its severest visitations."

CHOLERA EPIDEMICS. Particular attention is paid to the instructions contained in Government of India, Home Department, Circular No. 5 San. dated 28th August 1893, to conduct investigations on the occurrence of a cholera epidemic, and the following points are noted:—

- 1. The history of cholera during the last few years.
- 2. The date on which the first case occurred.
- 3. The source and probable cause of the disease, subsequent circumstances leading to the progress, fall, and disappearance.
- 4. Whether the disease was imported from some other place, if so, whence?
- 5. The number of towns and villages attacked.
- 6. The number that escaped.
- 7. Distribution of disease by locality.
- 8. The sanitary condition of the place, mentioning drainage, conservancy, water-supply, food, clothing, and the degree of overcrowding, if any existed.
- 9. Conditions of climate at the time.

When cholera breaks out in Ajmere, the District Superintendent of Police is at once asked to instruct the Police Inspector to report to the City Hospital Assistant, all cases of diarrhœa and cholera that may occur daily in the city, and suburbs, of Ajmere, and to take precautions to prohibit the sale of stale meat, rotten fruit, and other such articles of food.

- 2. A cholera camp is at once opened.
- 3. Special attention is paid to the sanitation of the place.
- 4. When cholera prevails in the District, cholera pills are sent to the District Superintendent of Police for distribution in the villages, and all available help is rendered by the local Hospital Assistant. No specific treatment appears to have yielded results better than those obtained by the ordinary treatment of cholera, combined with proper accommodation and good and efficient nursing. The history of the different epidemics goes to show that, at the beginning of the outbreak the mortality is high, the death-rate decreasing as the epidemic goes on, and that towards the end the attacks are milder and the mortality comparatively low.

Statement showing deaths from Cholera and Small-pox in Ajmere.

VACCINATION.

Vaccination was established in Ajmere-Merwara in November 1853 by Dr. Lord, who was Civil Surgeon of Ajmere at that time. Dr. Lord applied to the Medical Board for vaccinators, and two were employed on Rs. 10 each. The vaccination operations for the season 1853-54 were performed at the Dispensary and were carried on for five months during which time 127 individuals were vaccinated, of which 37 only were successful. After 1866 vaccination work was carried on in the City from house to house and not at the Hospital, and in 1867 a Native Superintendent was appointed with four vaccinators, paid by Government, and two by the Municipalities of Ajmere and Beawar.

Vaccination work continued to steadily increase year by year, and the number of vaccinators was increased in 1886-87 from six to eleven, with one Native Superintendent which is the present staff.

In October 1895 the Vaccination Act was extended to Ajmere City and Suburbs, and vaccination is now compulsory within the limits of the Ajmere Municipality. The vaccination season begins on the 1st of October and ends on the 31st March. During the season of 1895-96 the number of vaccinations performed in the Ajmere-Merwara District was 15,389, of which 15,147 were successful, giving an average of 984 per cent. of successful vaccinations. The average number of operations by each vaccinator was 1,399. The entire cost of all vaccinations for that season was Rs. 1,397, and for each successful case 17 pies.

After the introduction of the Vaccination Act into Ajmere City and Suburbs in 1895, the number of successful cases were more than doubled; during the vaccination season 1894-95, 1,503 individuals were vaccinated in the City and Suburbs, while in 1895-96, the first season after the Act was introduced, 3,188 vaccinations were performed.

Fresh human lymph is kept active throughout the year in Ajmere, and fresh supplies of calf lymph are received during each vaccination season, by which the lymph is kept active and efficient.*

FAMINE.

The Famine Code of Ajmere-Merwara, lately revised by the Government of India, is being published. In it the duties of officers of the various departments at the time of famine are prescribed, and arrangements made for the distribution of gratuitous relief, relief works, medical inspection and aid, poor houses, kitchens, protection of cattle, utilization of forest, and other reliefs, etc.

The medical arrangements are as follows:-

- 1. The Chief Superintending Medical Officer of the Province shall be made responsible for the following duties:—
- 1. He should as soon as possible personally inspect any locality where any symptoms of abnormal suffering are observable, and shall submit a fortnightly return to the Administrative Medical Officer on the following matters:—
 - (1) Increase of illness and disease believed to be due to want of food.
- Owing to the difficulty in leaving Ajmere, the Civil Surgeon is rarely able to inspect vaccination or even dispensaries in the district. It is hoped that the appointment of an Assistant Surgeon may be made to enable him to perform these duties—T. H. H.

- (2) Number of cases of deaths due directly or indirectly to want of food, or cases of illness induced by want of food which have been brought to his notice.
- (3) Number of in and out-patients received in the hospitals or dispensaries of the district and in any special famine hospitals, which may be under the control of his subordinates, with such details of the cases as may be required.
- (4) The distribution of the subordinate medical staff and any increase to it that may be required.
- 2. He will specially direct attention to the water-supply, the lowness of wells and tanks and other sanitary conditions of the tract affected.
- 3. He shall issue such special instructions as are neccessary, and advise the Civil officers regarding any alterations, he may consider necessary, in the rules for the treatment of famine patients, and in regard to their diet, and may, in case of urgency, issue direct any special instructions which he may consider necessary.
- 4. He shall, if necessary, from time to time, personally inspect and supervise the medical arrangements for famine relief and shall be responsible that such arrangements are duly made in each district. He shall advise and assist in laying out the camps at large relief works and other centres with special reference to the Hospital and water-supply.
- 5. At the end of any period of severe scarcity or famine he shall submit a general report on the operations of his department in connection with Famine Relief.
- 6. The Medical Officer in Civil Charge of a district shall also send copies of the fortnightly reports, required under para. 1, to the Assistant Commissioner, and shall also be responsible for reporting all cases of deaths (caused directly or indirectly by want of food) starvation, or illness due to starvation which may come to his knowledge.
 - 7. He shall make tours through the district-
 - (a) to inspect all medical and sanitary arrangements at relief works and centres;
 - (b) to ascertain, by weighment and otherwise, if the physique of the relief workers is being properly maintained;
 - (c) to examine the grain and other food which form the famine rations;
 - (d) to ascertain the condition of the people of the district generally.

A special Medical Officer should be appointed, if possible, for the purpose of these tours, otherwise they will be made by the Medical Officer in Civil Charge of each district, or as the Chief Commissioner may direct.

8. Hospital accommodation shall be provided at every relief work for the sick, as far as possible. A resident Hospital Assistant will be provided for every large work; if there be no Medical Officer on the work, his duties shall be performed, as far as may be, by the officer in

charge, who shall send all cases of serious illness to the nearest place at which medical treatment is obtainable. The Hospital shall be inspected daily. Should serious illness, such as cholera, small-pox, or dysentery break out, the Officer in charge shall immediately send information to the Medical Officer and to the Assistant Commissioner.

- 9. The Medical Officer in Civil Charge of a district shall, if required by the Assistant Commissioner, specially inspect the labourers and visit the Hospitals at relief works or poorhouses, and shall aid the Civil Authorities in making the necessary arrangements for sanitation and for the proper care of the sick.
- 10. If the wage paid or ration given on any relief work, in any famine institution appears to the Medical Officer in charge of the district, or of the work or institution, to be insufficient for the support of the labourers or inmates, the Medical Officer shall report the matter to the Assistant Commissioner, who may order the ration to be increased, pending the order of the Commissioner, to whom the matter shall be reported.
- poor house as is consistent with health. The Hospital shall be in charge of a Medical Officer.

The Hospital establishment will be selected by the Medical Officer, care being taken to engage paupers as far as possible.

The Hospital Assistant in charge of the poor-house Hospital shall send in to the Superintendent, a daily return showing the number of sick in Hospital, the daily admissions, discharges, and deaths, and the number of rations, and the quantity of extra food required for his patients. He should notice the condition of all the residents to see if they are improving, or the reverse. He should report at once to the Superintendent or the Civil Relief Officers if he believes the food to be insufficient or bad in quality.

For those who are specially emaciated he should prescribe special diet, such as milk, or ghi, or other nutriment. He should also report to the Superintendent, if he thinks that in any case the work exacted is too severe for any of the paupers.

HISTORY OF FAMINES IN AJMERE.

Since the beginning of this century, the first famine occurred in the Ajmere-Merwara District in 1812 and 1813, the second in 1847 and 1848, the third in 1868-70, and the fourth in 1890-92. Between these visitations there were periods of scarcity, but none of them assumed the proportions of a famine.

The famine of 1890-91 extended practically over the whole of Ajmere-Merwara, which covers an area of 2,710 square miles with a population of 542,358. It was a *tirkal* or triple famine of grain, water and fodder.

The Railway, which was opened from Agra to Ajmere in 1875 and was extended from Ajmere through the north of the Merwara District to Ahmedabad in 1880, saved the two districts from a disastrous mortality.

In the famine of 1868-70 the loss of population was estimated at 25 per cent or 106,500 out of 426,000; the mortality among the cattle was nearly 33 per cent. The price of staple food-grain was 3 seers per rupee, and the grain stocks had altogether failed, whereas in the famine of 1890-92 very few authenticated cases of starvation were reported. The mortality was, no doubt, abnormally high after the famine was over, owing to the outbreak of a fever epidemic.

The loss of cattle, notwithstanding extensive emigration, was extremely heavy, being about 20 per cent. or 187,481 out of 925,213 head of cattle. The Railway could carry sufficient grain to meet all food requirements, but the grass and other local fodder supplies entirely failed, and it was impossible to import enough grass at rates within the means of the people to keep the cattle alive.

During the famine year of 1868 the average rainfall of the Ajmere District was 9.28 inches, and that of Merwara 6.77 inches.

During the famines of 1890-92 the rains were very deficient in quantity and unfavourable in distribution. The average rainfall for Ajmere, calculated on the returns for the 33 years ending 1892-93, is 21.84 inches, and for Merwara 20.28 inches.

In 1891-92 only 8:50 inches of rain fell in the Ajmere District, and 10:24 inches in Merwara; this was even worse than in 1890-91, when the returns showed an average of 12:05 inches for Ajmere and 13:56 inches for Merwara.

The number of those who left the District during the famine of 1868-69 was stated to be 23,345 distributed as below:—

From .	Ajmere	•	•	•	•	•	•	•	•	•	14,152
From	Merwara	•	•	•	•	•	•	•	•	•	9,193
											23,345

The emigration commenced in October 1868 and continued till March 1869. Of this number, as many as 10,950 finally returned.

The subjoined table gives the number of persons who emigrated, of those who returned. and of those who either died or remained away during the famine of 1890-92:—

	And the state of t		District	t.				Emigrated.	Returned.	Diedor remained away.
Ajmere	•	•	•	•	•	•		32,219	23,763	8,456
Merwara	•	•	•	•	•		•	6,209	4:554	1,655
					To	Γ AL		38,428	28,317	10,111

^{*}During the famine of 1868-70 several relief works were opened in the District. The total cost to Government amounted to Rs. 7,59,407, and the daily average number of persons

employed on relief works under the supervision of the Public Works Department stood at 9,742. During the famine of 1890-92, the daily average number of labourers on relief works was 11,682 and the cost amounted to Rs. 12,54,116.

POOR-HOUSES.

Altogether three poor-houses were opened during the famine of 18g0-92 in the Ajmere Merwara District, viz., at Ajmere, Beawar and Todgarh. They were useful in three ways:—in providing maintenance for destitute persons who could not work; as a deterrent to lazy beggars who thronged the larger towns; and as a means of punishing famine labourers who would not work.

The poor-house at Ajmere was opened in January 1892, and was closed for admission on the 1st September 1892. On the 15th September the few remaining inmates were handed over to the Committee formed for the distribution of private charity.

The poor-house at Beawar was opened on the 23rd April 1892, that at Todgarh was originally started in January 1892 for the reception of sick persons who were really better qualified for the Hospital.

It was remodelled on the lines of a poor-house in June 1892. Thus the poor-house at Beawar was only open for five months, and that at Todgarh for three months.

The following statement shows the number of rations served in the poor-houses, and the cost of maintenance of the inmates during the famine:—

	Dis	57 R1CT.				Number of rations served.	Cost of dieting.	Cost of building and establishment etc.	Total cost of poor-houses.
							R a. p.	R a. p.	R a. p.
Ajmere	•	•	•	•	•	7,203	463 7 2	1,119 13 4	1,583 46
Merwara	•	•	•	•	•	6,034	459 15 9	1,351 2 0	1,811 19
Name the same of t			To	TAL	•	13,237	923 6 11	2,470 15 4	3,394 6 3

The largest number on any one day in the Ajmere poor-house was 131, while the largest average daily number during any month was only 42, namely, in June 1892.

The total number of persons admitted into the Beawar and Todgarh poor-houses was 358. The largest number in the former was 105 in July, and in the latter 49 in June 1892.

Home labour was provided for *purdahnashin* women, deserted widows, and children, and other destitute persons who were unable, for reason of caste or otherwise, to come to the relief works, and for whom no other means of support could be found. This branch of relief was started in October 1891 and was closed in August 1892; 479 279 persons were

given such relief at a cost of Rs. 77,592, viz., 479,267 persons in Ajmere District, and 12 persons in Merwara, costing Rs. 77,485 and Rs. 107, respectively.

IRRIGATION:

Before the famine of 1890-92 irrigation works in Ajmere-Merwara numbered 3,689, as detailed below, constructed at an aggregate cost of Rs. 43,30,832 up to 1877 (i. e., Ajmere Rs. 30,09,933: Merwara Rs. 13,20,899):—

										N	o. of tank	5.
I.	Ajmere	Khalsa	•	•	•	•	-	•	•	•	1,235	
2.	,,	Istimrar	•	•	•	•	•	•	•	•	1,353	
3.	"	Jagir	•	•	•	•	•	•	•	•	452	
4.	Merwai	:a .	•	•	•	•	•	•	•	•	649	
								Тот	ΓAL	•	3,689	

During the famine years of 1890-92, 104 irrigation works were undertaken in the district, vis., 48 in Ajmere and 56 in Merwara. The total cost incurred on the above works is given in the following table:—

	Distri	cr.	•	No. of irrig taken duri 18	ation wo ng the fa	rks under- mine of	То	tal cost in rup	oces.
Ajmere Merwara	•	•	۳ •	<i>Imperial</i> . 41 56	Local. 7	Total. 48 56	<i>Imperial</i> . 4,96,174 1,39,854	Local. 2,16,034	Total. 7,12,208 1,39,854
	To	TAL	•	97	7	104	6,36,028	2,16,034	8,52,062

With the aid of the Takavi loans granted under the Land Improvement Loans Act, 1896, tanks were either constructed or improved during the late scarcity in addition to the number in the foregoing table. The works thus undertaken are expected by the Civil authorities to be remunerative.

LUNATIC ASYLUM.

Before the opening of the new General Hospital there were four rooms attached to the old hospital in the city, sufficient for accommodating four lunatics.

At present lunatics are kept in the Jail Lunatic Asylum as a temporary measure. All confirmed lunatics, after observation, are sent to the Delhi Asylum.

A separate building for lunatics is urgently required for Ajmere-Merwara.

EDUCATION—MAYO COLLEGE.*

The late Lord Mayo, at a Durbar held at Ajmere in 1870, proposed to the assembled. Chiefs of Rajasthan that they should subscribe towards the endowment of a college for the education of their sons and those of their Thakurs or nobles, promising on behalf of the Government of India a sum equal to the aggregate amount collected.

The object of the college was declared to be not merely the acquirement of book-learning, but the stimulation of that energy of mind and body, which the nobility of Rajasthan so warmly admire in English gentlemen, and for the attainment of which they themselves are so peculiarly fitted. The Viceroy's proposal was met in the most liberal spirit, 15 of the 18 states of Rajputana promised subscriptions amounting to Rs. 6,26,000, and the Government of India fixed its contribution at seven lakhs. The following body called the Council is constituted as follows:—

President :

His Excellency the Viceroy.

Vice-President :

The Agent, Governor General, for Rajputana.

Members :

The Commissioner of Ajmere.

The 15 Chiefs who subscribed to the endowment, and the Maharawals of Jasilmer and Dungarpur, and the Political Officers accredited to the several States.

Secretary:

The Principal of the Mayo College.

At the close of 1874 the late Colonel Sir Oliver St. John was appointed the first Principal, and the college was opened for the reception of boys in October 1875. The total number of admissions up to the 30th September 1896 was 262, of which 72 were on the college roll of that year. Major (now Colonel) Powlett officiated as Principal of the college for two months in 1878, and was relieved by Captain (now Colonel) Loch, A. D. C., the present Principal.

Boarding houses have been built by the following States at their own expense:-

Oodeypore to accommodate 12 pupils.

Jeypore	"	"	10	do.
Jodhpore	"	,,	I 2	do.
Bikanir	"	,,	10	do.
Ulwar	,,	,,	7	do.
Bhurtpore	"	"	7	do.
Jhalawar	11	**	6	do.
Tonk	"	,,	7	do.
Kotab	**	**	7	do.

^{*}The Mayo College and Government College are under the medical charge of the Civil Su geon, -T. H. H.

The Mayo College main building, the Ajmere boarding house (to accommodate 12 boys) the Principal's and the Head Master's residences were built by Government. There are no tuition fees except for drawing, which is a voluntary subject. The only demand which is made from the parents of the boys is the small sum of Rs. 50 per annum, and known as the Book, Play, and Medical Fund.

The college curriculum includes:-

- (a) English,
- (b) General Knowledge,
- (c) Hindi and Urdu, with its corresponding classical language Sanscrit or Persian,
- (d) Arithmetic,
- (e) History and Geography.

The boys are well provided for and looked after physically.

Riding, gymnastic exercises, all games, and target practice are taught.

The Civil Surgeon, Ajmere, is in medical charge of the college, and the health of the boys is excellent. The Budget Estimate for year 1897-98 is as follows:—

										Rs.
Receipts	•	•	•	•	•	•	•	•	•	48,5 86
Expenditure		•	•	•	•	•	•	•	•	48,360
							Sur	plus	•	226

In Ajmere City there are various institutions imparting education to 1,921 boys and girls.

There are the City	Bra	nch S	chool	with	•	•	•	340	scholars
Government college	:	•		•	•	•	•	383	"
Mayo college	•	•	•	•		•		80	,,
Missionary School	•	•	•	•	•	•	•	236	,,
Arya Samaj School		•		•	•	•	•	476	'))
Railway School		•		•		•	•	51	"
Convent School		•	•	•	•		•	40	"
Normal School		•	•	•	•	•		12	"
Girls' School.			•	•	•	•		103	"
Durgah School		•	•	•	•	•	•	200	,,
								1,921	- ,

Of this total, 1,292 are Hindus, 498 Musalmans, 125 Christians, and 6 others.

This statement does not include schools under private management, such as the Mission Girls' Schools, a Parsee, a Deccani, a Church of England, Native, and a Bengali School; probably all these together give instructions to about 150, and besides these there are some fifty small Native schools teaching the elements to some 1,500.

1.

The City Branch School and the Government College, as also the Girls' Schools and the Normal School are assisted from Municipal Funds, are under Government control, and are directly under the supervision of the Principal of the College.

The Government College, affiliated to the Calcutta University in 1861, was affiliated to the Allahabad University in 1888, and until the present year, 1896, the standard taught did not go beyond the First Arts or intermediate examination of these Universities. Boys on completing their course here proceeded to the colleges of the North-Western Provinces to take their degrees, but in July 1896 classes were opened for the instruction up to the B. A. standard. The citizens of Ajmere and Beawar contributed handsomely towards an Endowment Fund, which is supplemented by grants from the Municipalities of Ajmere Beawar, Nasirabad and Kekri, and it is hoped that Government will complete the sum necessary for the maintenance of a full staff. There are, in 1896, 42 boys in the Entrance Class preparing for their Matriculation, whilst in the four college classes there are 55.

In the College is a well-stocked library and a collection of scientific apparatus, and in its grounds is a boarding house for the accommodation of boys attending the Normal School, and of boys from the village schools who have obtained scholarships. Provision is made for 50 boys.

The staff of the College and Branch School consists of the Principal, the Head Masters of the two institutions, 6 Professors, 13 English teachers, 9 Pundits, 9 Moulvies, and a Librarian clerk.

The Mission School teaches up to the Entrance Standard, the Arya Samaj School (founded in 1888) to the same.

Both these schools serve as feeders to the Government College, as do also the schools at Beawar and Nasirabad.

These two last mentioned are managed by the United Presbyterian Mission and are in receipt of aid from Municipal or Cantonment Funds, and of a grant-in-aid from Government.

They are inspected by the Principal of the Government College in his capacity of Inspector of Schools. They provide instructions for 357 and 307 boys, respectively, and teach up to the Entrance Standard.

During the year 1876-77 the District Schools were reorganised. They are supported by Government and from the educational share (one per cent.) of the 3½ per cent. cess. Since then there has been no change in the number of schools, they remain 8 Tehsil (secondary), and 41 Hulkabundi (primary), but whereas in 1876 the total number of boys attending these schools was 1,770, the total now is 4,085, of whom 2,788 are in Ajmere, 1,297 in Merwara. It is expected that steps will shortly be taken whereby the number of these village schools will be extended. A small but efficient Normal School, where promising boys from the village schools are trained as village school teachers, is accommodated in the Government College.

Female education does not make much progress. There are two schools in Ajmere City and one each at Rajgarh, Beawar and Kekri, with altogether 231 pupils.

The following statement gives statistics of the schools above mentioned.

JAIL.

Before 1860 all the prisoners of this district were lodged in the Abdullahpura-ki-serai in the City near the Railway Station. The present jail was built sometime after that year, and the prisoners were transferred to it from the old jail near the Railway Station.

In the beginning, the jail consisted of an inner circle and a main wall only, the barracks, outside the inner circle, viz., Nos. 10, 11, 12, 13 and 14, were added during the years 1872-73.

1875. A range of twelve new solitary cells was added in 1875, and the treadmill with the 1879. roofed building for it, was built four years later in 1879.

In 1880 the old latrine in Barrack No. 2 was removed and was replaced by a new one. The tile-roofed latrines in Barracks Nos. 4, 5, 6 and 8 were removed, and smaller and tidier latrines with Slabbed roofs were built in their stead. One of the store godowns was converted into a ward for European prisoners during 1881-82, and additions in the shape of one verandah and one bath-room were made.

A new Barrack for the reception of under-trial and juvenile prisoners was commenced 1883. during 1882 and completed in 1883 at a cost of Rs. 1,313.

The single-storied Barrack in ward No. 9 was converted into a double-storied one in the year 1884, at a cost of Rs. 5,674-6-11.

1885. In 1885 the approach to the Havalat, hitherto quite open and unprotected, was screened in by the erection of a wall and a gate, two rooms for the Havalat Guard being added at the same time.

During the year 1886 twelve new quarters with court-yards at the back were built for jail warders and a factory erected in the juvenile ward. In ward No. 1 a new double-storied Barrack was commenced and completed in the next year, when also the old chulas were replaced by new ones built according to the standard plan of the North-Western Provinces jails, at the suggestion of the Inspector General of Jails, North-Western Provinces and Oudh. Alterations improving the ventilation of the solitary cells and effecting complete isolation of the prisoners therein confined, were made and the latrines, in the Civil prisoners' Barrack, were provided with gratings. The scarcity of water in the jail well having necessitated the digging of a new well, one was commenced in the Mir Shah Ali garden, and the present well commenced in 1887 and completed in 1888 was the result. Pipes were laid down from the Mir Shah Ali well to the jail between 1888-89.

During this year, the gratings of six Barracks which were unsafe and did not afford thorough ventilation, were removed and replaced by new ones of a larger size, and in addition to these, two grated windows were fixed in the end walls of each of the six Barracks corresponding to the doors in front. The water pipes were extended from the outer circle to the inner circle of the jail and also to the garden. The open space between the outer and the inner gateways of the jail was roofed. The old dead-house near the jail was converted into a contagious disease ward.

The tiled-roofs of workshops attached to Barracks Nos. 7 and 8 were replaced by stone 1892. slahs.

1803.

Pipes were laid down from the Merwara Battalion lines to the jail, so that in times of scarcity water may be available from the Foy Sagar.

A new enclosure containing worksheds, which was begun in the preceding year, was completed during this year. Two bathing platforms, one inside the jail for convicts, and another outside the jail for jail warders and under-trial prisoners, were finished during the year, and the quarters for the Merwara Battalion guard were provided with a slab roof.

An armoury was built in the verandah of the factory godown near the main gate A Donaldson's patent Ejector, for removing night-soil outside the jail, was fixed in the jail enclosure-wall towards the jail garden. A compound wall in front of the jail was constructed during the year.

According to the suggestions laid down by the Commissioner in his remarks dated 14th September 1894, in the visitors' book, a better canopy over the central watch-tower has been constructed, and two openings in the roof of the kitchens, for the escape of smoke, were made during the year. In July 1805 the jail staff was re-organised at the suggestion of Brigade-Surgeon-Lieutenant-Colonel Sir Alfred Lethbridge. Under this re-organisation the staff of the jail was reduced, made cheaper, and more effective. A reserve guard was established, who are armed, drilled, and wear a distinctive uniform. This guard has taken the place of the Merwara Battalion Guard who for so long guarded the entrance to the jail. The management, discipline and manufactures of this jail have been brought by degrees, and under the superintendence of successive Civil Surgeons, to its present state of high effeciency, and on account of its central position, is very properly looked upon as a model for the jails of neighbouring States. The carpet manufactory is second-to-none in all India, and carpets of the finest wool, of beautiful designs and of the best manufacture, are made in the jail all the year round.

These carpets are ordered in much larger numbers than the jail Factory can ever comply with; the principal reason for which is that fewer long-term prisoners are now sent to this jail than in former years.

During 1895 the actual profit of the jail Factory amounted to Rs. 4,001-12-6, and the average earning of each prisoner in the jail amounted to Rs. 14-1-9 for the year.

The health of the prisoners in the jail is excellent, and the average mortality and admissions to Hospital, are low. 1895, owing to an epidemic of relapsing fever, was an exceptionally bad year.

sailed statement of the Permanent Establishment of the Central Fail, Ajmere, as it stood on 1st April 1896.

CHIEF TOWNS.

In the Ajmere-Merwara District there are four chief towns—three in Ajmere and one in Merwara.

In the Ajmere District the three chief towns are—Ajmere, previously described, Nasirabad and Kekri.

Nasirabad has a population of 21,710 and is a military station, 15 miles from Ajmere by a good metalled road, and is also connected with Ajmere by railway.

Kekri has a population of 7,100 and is 50 miles by a metalled road from Ajmere; there is a Dispensary at Kekri: this town is increasing as a market, and the small annual Tejaji Fair is becoming a recognised commercial as well as religious institution.

In Merwara, Beawar is the chief town, with a population of 20,978 and is 33 miles from Ajmere by a good metalled road, or by rail. There is a dispensary at Beawar. Beawar is growing into the chief market of import and export in Western Rajputana. The principal export is pressed cotton. Beawar is a very modern town, and was founded about 1835.

CIVIL SURGEON'S DUTIES.

The duties of the Civil Surgeon of Ajmere are many, and the claims made on his time are extensive.

He is in charge of the General Hospital, including the Police Hospital and district dispensaries, is Consulting Surgeon to the Railway, which includes regular visits to the Railway Hospital where he sees all the in-patients and any out-patients wishing to consult him; he has to attend on families of officials of the Railway who ask for his advice, and he has to examine all candidates for employment in the railway, as well as Government officials employed by the railway applying for pension. He is Superintendent of the Central Jail and is responsible for the entire working of that institution. He is in Medical Charge of the Merwara Battalion, and performs all the work of Medical Officer to that Regiment. He is Medical Officer to the Mayo College and to the Government College. He is an ex-officio member of the Municipal Committee, attends Municipal meetings and makes weekly sanitary inspections of the City and Suburbs, and is convener of the sanitary Sub-Committee. He is Superintendent of the Vaccination Department for Ajmere-Merwara, and is in Medical charge of the Civil Station of Ajmere. It is, therefore, impossible for him to attempt anything like a tour into the district, to inspect outlying dispensaries, or to check vaccination operations, or inspect village sanitation. His multifarious duties will not admit of his leaving Aimere, except under exceptional circumstances, for which special arrangements have to be made.

Ajmere is just one of those Civil Medical charges, which would greatly benefit by the proposal of Government, if carried into effect, which was recently made to provide some Civil Stations and Districts with an Assistant Surgeon, who, acting under the Civil Surgeon's orders, could be deputed to make periodical inspections in the district of vaccination, of sanitation, of the district dispensaries and be made responsible for the correct collection of all vital statistics which are at present very defective.

List of Civil Surgeons of Ajmere from the date of the opening of the Ajmere Dispensary.

LIST OF COMMISSIONERS OF AIMERE-MERWARA.

The following information was kindly supplied from the Office of the Commissioner, Ajmere:

List of Commissioners of Aimere-Merwara.

Prior to 1853 the Officers in charge of Ajmere and Merwara were styled Superintendents, and corresponded, first with the Resident at Delhi, subsequently with the Resident in Malwa and Rajputana, and after 1832 with the Commissioner. From 1858 the united districts remained a Deputy Commissionership under the Agent to the Governor General and Commissioner, who, in his latter capacity was subordinate to the Government of the North-Western Provinces till 1871, when the Province was formed into a Chief Commissioner ship under the Foreign Department of the Government of India, and a Commissionership of its own, the Chief Commissioner being the Agent to the Governor General for Rajputana.

- 2. The Superintendents between 1818 and 1853 were Messrs. F. Wilder, Henry Middleton, The Hon'ble R. Cavendish, Major Spiers, Mr. Edmonstone, Lieut. and Colonel Dixon. The exact dates of their holding the office of Superintendent cannot be traced; but the approximate period for which each of them held that office is given below:—
- (1) Mr. F. Wilder, 26th July 1818 to November 1824.

 - (2) Mr. H. Middleton, December 1824 to September 1827. (3) The Hon'ble R. Cavendish, October 1827 to October 1831.
 - (4) Major Spiers, November 1831 to November 1833.
 - (5) Mr. Edmonstone, December 1833 to December 1836.
 - (6) Lieut. Macnaghten, January 1837 to January 1842.
 - (7) Major (afterwards Colonel) Dixon, February 1842 to June 1857.

Ma-Between 1853 and 1857 Colonel Dixon was styled Commissioner of Ajmere-Merwara, and he corresponded direct with the Government of the North-Western Provinces under which Administration Aimere was placed in 1832 and Merwara in 1846.

- 3. The Commissioners, with the office of Agent to the Governor General for Rajputana attached to them, so far as the office has been able to ascertain, were Major Spiers, Colone Alves, Colonel Sutherland, Major Thoresby, Colonel Low, Colonel Sir Henry Lawrence, Major-General Sir James Outram, K.C.B.; Major (afterwards Colonel) W. F. Eden, Colonel E. K. Elliot, Colonel R. H. Keatinge, and Colonel J. C. Brooks. The approximate period for which each of these officers held the office of Agent to the Governor General for Rajputana and Commissioner of Aimere-Merwara is given below: -
 - (1) Major Spiers, 1833 to 1834.
 - (2) Colonel N. Alves, 1835 to 1838.
 - (3) Colonel J. Sutherland, 1839 to 21st June 1848.
 - (4) Major C. Thoresby, March 1844 to March 1846 (officiating during the time Col. Sutherland was on leave).
 - (5) Colonel J. Low, C.B., July 1848 to 24th December 1852.
 - (6) Colonel Sir H. M. Lawrence, 5th March 1853 to 16th March 1857.

Norg.-Lieutentant-Colonel (afterwards Brigadier-General) G. St P. Lawrence officiated from 25th mamber free to 4th March 1800 pending arrival of Colonal Sir H. M. Louvance

(7) Major-General Sir James Outram, K.C.B., from 17th March 1857 to 10th September 1857.

Note.—Brigadier-General G. St. P. I awrence officiated from 17th March 185? to 10th September 1857.

Major-General Sir James Outram was appointed to the post of Commissioner, and Agent Governor General for Rajputana, but he did not actually join the appointment.

(8) Brigadier-General G. St. P. Lawrence, from 11th September 1857 to 30th April 1864.

Nors.—Brigadier-General Lawrence was on 18 months' leave (15 months' sick leave and 3 months' privilege leave) from about 25th April 1859 to 25th October 1860. During this period Major (afterwards Colonel) W. F. Eden officiated.

- (9) Colonel E. K. Elliot, 1st May 1864 to 2nd April 1865.
- (10) Colonel W. F. Eden, 3rd April 1865 to October 1867.
- (11) Lieutenant-Colonel (afterwards Colonel) R. H. Keatinge, C.S.I., V.C., from November 1867 to 31st March 1871.
- (12) Colonel J. C. Brooke, officiating, 18th June 1870 to 31st March 1871.
- 4. The following is the list of Chief Commissioners of Ajmere-Merwara, and Agent to the Governor General for Rajputana, from 1st April 1871 to date:—
 - (1) Colonel R. H. Keatinge, V. C., C. S. I., 1st April 1871.
 - (2) Colonel J. C. Brooke, 1st April 1871 to 20th June 1873.
 - (3) Colonel Sir Lewis Pelly, K.C.S.I., 21st June 1873 to 11th November 1874.

 Colonel W. H. Beynon officiated about 3 months.
 - (4) Mr. (afterwards Sir.) A. C. Lyall, from 12th November 1874 to 11th December 1878.
 - Major C. K. M. Walter officiated, November 1876 to April 1877.
 - (5) Lieutenant-Colonel (afterwards Colonel) Sir E. R. C. Bradford, K.C.S.I., 12th December 1878 to 26th March 1887. Lieutenant Colonel C. K. M. Walter officiated during Colonel Bradford's furlough from 17th March 1881 to 28th November 1882.
 - (6) Colonel C. K. M. Walter, 27th March 1887 to 19th March 1890.
 - (7) Colonel G. H. Trevor, C.S.I., 20th March 1890 to 19th March 1895. (Colonel P. W. Powlett, C.S.I., officiated during Colonel Trevor's privilege leave from 28th August 1891 to 1st December 1891.)
 - (8) Mr. R. J. Crosthwaite, C. S. I., from 20th March 1895 to date. (Lieutenant Colonel H. B. Abbott officiated from 20th March 1895 to 27th October 1895, during Mr Crosthwaite's alsence on furlough.)

- 5. The list of Commissioners of Ajmere-Merwara, from 1st April 1871 to date, is given below:—
 - (1) Mr. L. S. Saunders, 15th May 1871 to 15th February 1885.
 - (a) Captain H. M. Repton, officiating, 16th July 1872 to 15th October 1872.
 - (b) Mr. James White, officiating, 8th to 27th March 1877.

 ,, 3rd May to 4th August 1878.
 - (c) Major J. H. Lassalle, officiating, 19th May 1881 to 26th June 1881.
 - (d) Mr. J. R. Fitzgerald, 1st August 1882 to 29th October 1882.
 - (2) Colonel W. Tweedie, 16th February to 25th June 1885.

 Mr. R. M. Dane, officiating, 16th February to 3rd March 1885.
 - (3) Mr. T. J. C. Plowden, 26th June 1885 to 13th November 1885.
 - (4) Lieutenant-Colonel (afterwards Colonel) G. H. Trevor, from 14th November 1885 to 19th March 1890.

Colonel K. J. L. Mackenzie officiated, during Colonel Trevor's privilege leave, from 20th August 1888 to 20th November 1888.

- (5) Colonel J Biddulph, 20th March 1890 to 6th January 1893.
 - (a) Captain A. F. De Laessoe officiated, pending arrival of Colonel Biddulph, from 20th March to 16th April 1890.
 - (b) Captain A. F. De Laessoe, and Major W. H. C. Wyllie, C.I.E., officiated from 4th July 1891 to 16th July 1891, and 17th July to 1st December 1891, respectively, during Colonel Biddulph's deputation as officiating Agent to the Governor General at Quetta.
 - (c) Mr. A. H. T. Martindale officiated from 13th April 1892 to 29th May 1894.
- (6) Colonel E S. Reynolds, 7th January 1893 to 22nd February 1894.
- (7) Colonel F. A. Wilson, 23rd February 1894 to 29th May 1894.

Note.-Colonels Reynolds and Wilson did not actually join the appointment.

(δ) Mr. A. H. T. Martindale, 30th May 1894 to date. Lieutenant-Colonel A. P. Thornton, officiating, from 21st March .895 to 27th October 1895.

Mr. H. V. Cobb, officiating from 2nd March 1896 to 8th August 1896. Lieutenant-Colonel A. P. Thornton, officiating, from 9th August 1896 to date.

1876.

Additional Notes by Lt.-Col. D. Ffrench Mullen, M.D., I.M.S. Civil Surgeon, Ajmere.

VITAL STATISTICS.

AJMERE CITY AND SUBURBS-POPULATION ACCORDING TO CENSUS OF 1891=69,165.

Registration of Births and Deaths. The registration of births is very defective.

- 1. For the seven years 1891-97 inclusive, only 13,289 births were registered, as against 14,544 deaths for the same period, showing an excess of deaths over births of no less than 1,255, which is absurd.
- 2. The minimum birth rate which may be accepted as correct is 35 per thousand; the Municipal figures give only 25, or a deficiency of 10 per thousand per annum, so that for the period of seven years under report at least 3,000 births remained unregistered.
- 3. I have taken the minimum birth rate of 35 per mille for purposes of comparison, as Ajmere suffers from many of the defects which are accountable for decreased birth rate, as well as for infant mortality. The predisposing causes are chiefly insanitary surroundings, overcrowded and ill-ventilated dwellings, deficient drainage, dearness of provisions, small-pox, malarial fevers due to polluted soil, mal-practice of mid-wives, parents' neglect, deficient clothing, etc. Most of these evils are remediable, and it is hoped that with compulsory vaccination and improved birth registration small-pox at all events will soon be removed from the above category—for the rest it depends on the Municipality and largely on the people themselves to supply the remedy.
- 4. Now that an Assistant Health Officer has been appointed, who supervises the registration of deaths and personally investigates the particulars in each case, it is highly desirable that the registration of births should be placed upon an equally satisfactory footing. For this purpose it is necessary that the Assistant Health Officer should be provided with an office for the purposes of registration, and record of births, deaths and marriages. The Municipality has sanctioned a sum of money for the erection of a Vaccination station, and the Registration Office might be included at a slight additional cost. Printed forms on parchment paper should be supplied for registration forms, which should be available in the future as evidence in a court of law of a birth, death, or marriage, as the case may be; this would be an inducement to parents and others to resort to registration.
- 5. The Municipality to pay a small sum for each registration, to be utilized for the payment of printing forms and office contingencies, etc.
- 6. The Assistant Health Officer to have charge of the Registration Office in addition to his other duties, with the title of Sub-Registrar, and the office to be kept open daily for certain hours to receive registration reports.
- 7. The above suggestions, if carried out, would entail very little extra expenditure on the Municipality as a small fee for each registration would cover all expenses for upkeep.

• PUBLIC HEALTH, AND FOY SAGAR WATER-SUPPLY.

- I. I have gone carefully into the subject of the effect of the Foy Sagar water-supply on the health of the city, and the result, as far as Mortality Statistics go, is not encouraging.
- 2. For purposes of comparison, I have taken the five years previous to the opening of the Foy Sagar, 1888-92, and the five subsequent years 1893-97. The comparison is partly vitiated by the fact that the mortality of the two periods is calculated on the census populations of 1881 and 1891 respectively; the tendency of this is to show an apparently higher mortality for the pre-Foy Sagar period and a lower mortality since the Foy Sagar was opened. To partly counterbalance this, the registration was more exact in the second period, and therefore the number of deaths registered was large.
- 3. The number of deaths registered from all causes from 1888 to 1892 was 7,310 equals a death rate per thousand of 24'97; ditto for the period from 1893 to 1897...... 10,447 deaths, which is equivalent to a death rate per thousand of 30 33. The difference in favor of the pre-Foy Sagar period is 5'36, so that the mortality of Ajmere City and suburbs has increased by 5'36 per thousand since the Foy Sagar water-supply was laid on.
- 4. A further analysis of the Mortality Statistics gives some consolation, as it shows a diminution in the number of the cases and mortality from what are known as water-borne diseases (that is, caused by impure or deficient water-supply).
- 5. There has been a decided decrease in the number of deaths from cholera and bowel complaints. The average number of deaths from cholera has decreased from 35.20 per thousand to 6.80 per thousand. The average number of deaths from bowel complaints has decreased from 226.60 to 171.00 per thousand. Guineaworm is also supposed to have diminished.
- 6. On the other hand the mortality from fevers has gone up from 664.40 to 1111.60 per thousand, and this increase is to a certain extent due to typhoid fever, which to my knowledge has largely increased since the new water-supply.
- 7. I expect little improvement in this respect until an efficient system of drainage is established. It is one of the first principles of public health that the amount of water removed from the city by drainage or other means should equal the water-supply entering the city, otherwise the soil is saturated, and the benefits of a good water-supply are negatived.
- 8. During the year 1896-97, 57 million gallons of water were supplied to the town from the Foy Sagar alone, and 3½ million gallons of liquid were removed by the conservancy tram; this does not include water supplied from wells, the Diggi, Jhalra, etc. None of this water is removed by drainage, and the ground is perforce waterlogged and polluted. Last year the inhabitants of Ajmere suffered to such an extent from malarial fevers that a sufficient number of persons could not be got to grind corn for food, and a public subscription was raised to buy quinine for the sufferers; the remedy is a proper drainage system.

MEMORANDUM REGARDING THE IMPROVEMENT OF FOY SAGAR WATER-SUPPLY.

The means of improvement come under four heads :--

- (a) Increase of supply from catchment area.
- (b) Restoration of water (which leaks through the bund) to supply pipe by mechanical means.

- (c) Purification of water by filtration before it enters the distribution pipes.
- (d) Prevention of contamination by villages in the catchment area.

AJMERE WATER-SUPPLY.

The population of Ajmere City and suburbs, according to the census taken in 1891 was 69,000, allowing for an annual increase of 4 per cent. the present population (in 1898) may be estimated approximately at 90,000. The daily quantity of water required for 90,000 persons at 5 gallons each is 450,000 gallons.

The average rainfall for 32 years 1866-97 is 23'75 inches.

The following are the chief sources of water-supply to the City and its adjacent suburbs:—

- 1. The Ana Sagar Lake.
- 2. The Diggi reservoir.
- 3. The Jhalra reservoir.
- 4. The Foy Sagar.
- 5. Various pacca wells.
- 6. Budha Pushkar Lake.
- 7. The Ana Sagar Lake.

The water of this lake has not been used for drinking purposes since the opening of the Foy Sagar.

- (1) It is utilized for irrigating the public gardens: average annual consumption=24 millions cubic feet.
- (2) For supplying dhobies' cisterns, bathing ghats, and cattle troughs: annual expenditure 7:38 million cubic feet.

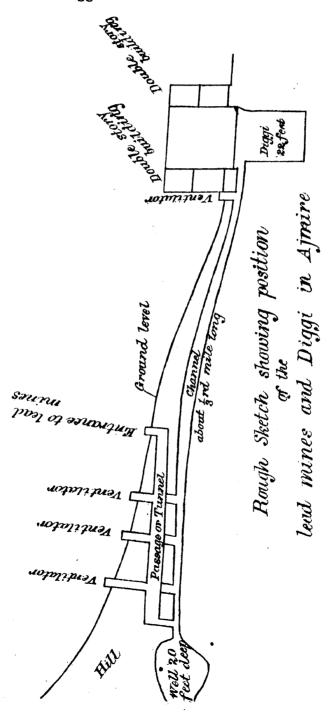

The vertical loss by evaporation and in filtration is about 5.5 feet.

The bed of the lake was completely dry in 1891 and since then the water has remained at a low level on account of the Foy Sagar cutting off 8 miles of the principal catchment area. The result of the low water level is that the Ana Sagar gives forth an unbearable stench for several months of the year, rendering the bungalows in its neighbourhood uninhabitable, as well as being a source of danger to the public health. The Commissioner's house, which is on the bund, is Government property, and it is exposed to the noxious effluvia arising from the lake, so that if something is not done, Government will have to provide a new residence for the Commissioner. Several schemes have been brought forward to remedy this unsatisfactory state of matters, but the one that appears to me the most feasible is to form an island in the centre of the lake by throwing up the silt all round. The bed of the lake, which has doubtless silted up considerably since its construction in the eleventh century, would thus be deepened to its former level and evaporation reduced considerably owing to the diminished area of water surface exposed; this area would depend on the size of the central island. The Municipality is not in a position for monetary reasons to carry out this proposal, it would have to be done as a famine work.

(2) The Diggi reservoir, a rough plan of which I submit, was opened out by Col. Dixon in 1834. It is 170 feet long by 100 feet wide and 20 feet deep; it is supplied with water from the disused lead mines at the foot of Taragarh by a masonry channel. The Diggi

has overflowed all through the hot weather for the last two years; the water is potable and is largely used by the inhabitants in its vicinity; it would be interesting to take a census of the daily number of persons using it, as well as the water of the Jhalra.

The water of the lead mines being at a high level, could be utilized to supplement the Foy Sagar water by being laid on to the Railway workshops or in other ways at present. The overflow water of the Diggi runs to waste.

(3) The Jhalra reservoir. This is a deep cleft in the rocks at the base of Taragarh and close to the Durgah (Mohamed Mosque); it is fed principally by infiltration from the neighbouring hill and partly by surface drainage, it is of doubtful quality, but is rather extensively used for household purposes; no washing of clothes is allowed in the tank.

During the water famine in 1891-92 a steam pump was fixed and a useful supply of water obtained at a critical period; it is not advisable to encourage the use of this water for drinking purposes.

(6) Budha Pushkar Lake is a natural depression among sand hills without any outlet and is situated about 5 miles north-west of Ajmere. It has a water spread of 087 sq. miles at the reduced level of 129 feet, and at this level it contains 20 millions cubic feet. Its catchment area is 14 sq. miles, but in addition it appears to be constantly replenished from the water stored up in the sand of the surrounding valley which represents the accumulation of years. The lake area may be said to extend over the whole valley while evaporation is confined to the exposed water surface, hence the loss from this cause is slight and the amount of water in the lake is not perceptibly affected by a year of deficient rainfall, it merely indents more fully on the underground supply stored in the sandy soil around. During the water famine in 1891-92, water was conveyed to Ajmere by means of pipes and steam pumps. A new scheme for supplying water from Bhuda Pushkar at a cost of 11 lakhs has been provisionally approved by the Chief Commissioner, but is only to be put in force when the necessity actually arises owing to failure of other supplies. This scheme necessitates the lifting of the water, a height of 300 feet, over the Pushkar Ghat and a delivery of 30,000 gallous per hour for 15 hours daily. The water of the lake is potable.

I. Increase of supply.

There are two villages in the catchment area, Ajesar and Karekri. Ajesar comprises two small villages within a short distance of each other. There are three kaccha tanks in the catchment, two belonging to Ajesar, of which one probably deprives the Foy Sagar of a week's supply for Ajmere; this tank should be shut up. The two other tanks are very small, and one is too contaminated by proximity to the village to be interfered with. As regards Karekri there is no tank attached to it, but it drains directly into the principal mallah which supplies the lake, and its cleanliness is a matter of great importance.

A sum of money should be spent annually before the rains in opening up the nallahs in the catchment, and in the removal of obstructions.

II. The leakage water should be caught in a small reservoir, and thence pumped into the supply pipe. The leakage water is already filtered in its escape through the bund. Major Spilsbury further recommends catch water drains along the base of the hills within the catchment area.

III. Purification.—It would cost about R80,000 to buy up the land in the catchment area of the Foy Sagar, and compensation for house property would bring the costs up to 2 lakhs or over; as an alternative I would suggest that the villages of Ajesar and Karekri should be placed under the Ajmere Municipality for sanitary purposes only. The Municipality should defray the extra expenses incurred by the villagers for conservancy, as the water-supply would benefit by the enforced cleanliness. Also a slight remission of land revenue should be made by Government to the villagers as a reward for cleanliness, and the village headmen should be remunerated in some way.

IV. The present contour of the lake at overflow level is marked by boundary pillars, within which, nominally, no cultivation is allowed. This prohibited area should be extended to a quarter of a mile from the present boundary pillars. This area might be handed over for a term of, say, ten years, to the Forest Department (a yearly rental to be paid to the villagers) and planted with fruit trees, such as mangoes, ber, etc. No manure need be used, as the alluvial soil from the bed of the tank would be sufficient—grazing might be allowed under supervision, and hay crops grown in the rains; the villagers might be utilized as far as possible looking after the trees, cutting the grass, and of course grazing their own cattle. In this way very little hardship would be inflicted and when the trees are fruit-bearing, the villagers to resume possession, subject to the above restriction. The lake should be amply stocked with fish as a means of purification, and to supply Ajmere with food.

In addition to the above measures, the water from the wells in the disused lead mines which at present flows into the Diggi reservoir, might be more fully utilized to supplement the Foy Sagar water-supply, either by being connected with the pipes, supplying the Railway Workshops, or by being distributed by supplementary pipes to other parts of the city. The water is potable and a lot of it goes to waste by overflow from the Diggi reservoir. It would be very advisable to bave a census taken of the number of persons resorting to the Diggi and Jhalra reservoirs for their water-supply. The Ana Sagar lake is used merely for washing purposes, cattle troughs, and irrigation. The area of the lake should be curtailed, to ensure a constant supply of water by minimising the loss from evaporation, etc.

VACCINATION.

The Ajmere Municipality keeps up a Vaccination Establishment at an annual expenditure of R637. This includes the pay of two Vaccinators, an allowance of R5 per mensem to the Government Native Superintendent of Vaccination for supervision, pay of a Moharir, stationery, etc.

Sanction has been lately given for the erection of a Vaccination Office at an estimated expenditure of R1,126. At present a ward in the General Hospital is used for the purpose—a matter of much inconvenience. A tabular statement is annexed showing the Vaccination work done during the years 1896-97 and 1897-98. It is satisfactory to note that there were only four deaths from small-pox in 1897, and none at all during 18 up to date, vis., 24th August 18

MEMORANDUM ON VACCINATION IN AJMERE-MERWARA.

The Vaccination Establishment consists of one Native Superintendent and 12 Vaccinators, one Moharir and one Chaprassi. For vaccination purposes the division of the District by Thanas is utilized, but as the number of vaccinators is too small, some of them have to work two Thanas instead of one, the result being that a number of villages are only visited once in two or even three years. The vaccination circle, which includes Kekri Town District and Sowar with a population of 72,000, has only one vaccinator. Bhinas circle with a population of 5,780 has only one vaccinator. In Merwara there is only one vaccinator for the three Thanas of Todghar, Dawair and Jassakhera. The population

is only 44,449, but the villages are scattered and the hilly nature of the country renders travelling difficult.

Two extra vaccinators are required for Ajmere District and one for Merwara District,

A1	M	E	R	E	•
----	---	---	---	---	---

MERWARA.

	Percentage of vaccinations to registerd births.	Percentage of vaccinations to registered births.	Difference in favour of Ajmere.
1896-97	88:41	77.5	10.83
1897-98	96•58	69.44	27'14

The above table appears to prove that Ajmere District is better protected by vaccination than Merwara, but a reference to Statement I. A. Vaccine Department, a copy of which is attached for the year 1897-98, shows that the ratio per thousand of population successfully vaccinated was as follows: Merwara 32.70, Ajmere 27.48. The explanation is that the birth rate of Merwara is given as 42.83 per mile, while Ajmere shows a birth rate of only 29.91.

The apparently favourable ratio of vaccinations to births in Ajmere District is due entirely to defective birth registration. In Bengal the following method of village registration of births is in use and has worked well, and I have recommended that the same procedure might be introduced here.

Registration is entrusted to the Police. Each chaukidar or village watchman is provided with a pocket book in which to record or, if illiterate, to get recorded by the village punchayet, all births and deaths which take place within his jurisdiction; these are reported at stated intervals at the police stations and out-posts which are the registering centres. The statistics thus obtained are checked from time to time by inspecting officers, including the District Magistrate, Police Superintendent, Civil Surgeon and his Deputies. If omissions are detected, the defaulting chaukidar is reported to the District Magistrate for punishment.

List of Vaccination Establishment in Ajmere-Merwara.

D. PF. MULLEN, M.D., SURGEON LT.-COL.,

Civil Surgeon, Ajmera.

CONSERVANCY.

The Municipality during the year under report spent R27,656-8-3 on conservancy; this includes a sum of R2,464 on account of extra establishments in connection with precautions against plague. There is a noticeable annual increase in the number of private latrines in the city. This is a matter of anxiety on account of the difficulty in keeping them clean.

I have made out a tabular statement showing the expenditure on Public Health by the Municipality during 1897-98. This expenditure comes altogether to R49,400, or 28.58 per cent. of their income, which I consider very creditable.

- 53. For the purposes of conservancy arrangements, the Ajmere Municipality is divided into eleven wards as under:—
 - 1. Madar Gate to Agra Gate; bounded on the east by city wall, and on the west by Naya Bazar and Purani Mandi.
 - 2. From Agra Gate to Dehli Gate; bounded on the east, by Naya Bazar up to the Chaupar, and on the west by the Dargah Bazar.
 - 3. From Naya Bazar Chaupar up to the Nala Bazar, via Ghiwala Gate and Gali Khazanchian, on the south from Gali Khazanchian up to the Dargah Bazar.
 - 4. Kayasth Mohalla, Purani Mandi up to Gali Khazanchian.
 - 5. From Madar Gate up to Usri Gate; bounded on the north by Nala Bazar, and on the west by Ghasiti and Diggi Bazar.
 - 6. From Ghasiti to Langarkhana Gali, including Nawab-ka-bera and Rega Mohalla.
 - 7. Lakhan Kotri, from Dehli Gate to Dargah Bazar, bounded on the east by Dargah Bazar, and on the south by Nala Bazar and Chauk Surat Ram.
 - 8. Khadim Mohalla, Shorgar Mohalla, Dargah, Lakhan Kotri, Silawat Mohalla and Inderkot.
 - 9. Kaisar Ganj, including Cavendishpura.
 - 10. Suburbs.
 - 11. Railway.

Notes,-Number of bullocks engaged on Tramway 20, on cart service 84; total number of bullocks 104.

Number of Tramway wagons . . . 73

Number of filth carts 46

Number of rubbish carts. . . . 16

The population according to the census of 1881 and 1891 respectively was 48,735 and 68,843. But as a number of persons resort to the fields around for obeying the calls of nature, and as filth of certain premises is not removed to the Trenching ground as explained in paragraph 62 of the Annual Report for 1895-96, the population served by the conservancy system has roughly been taken at 40,000 during the currency of the census of 1881, and 50,000 during the current census. The large increase in the population since 1881 to 1891 was mainly due to the Railway, as its opening in 1879 and the fact of Ajmere being made its head-quarters led to a great influx from outside. The settlers of 1879 brought their families to live with them or married and had children born to them Since the census of 1891 there has been some increase, but to what extent I am unable to

Annual Report on the Water-supply system of Ajmere for the year 1897-98, by Major Spilsbury, R.E.

During the year no changes have taken place in the water-supply system. The Foy Sagar is still the main supply. On the 1st April 1897 its level was 15'37 feet above the lowest sluice. The minimum reached before the rains was 10'44 feet on the 10th July. The highest level reached during the year was 22'05 feet on the 30th August; this is 1'95 feet below the lowest weir, and is about 15 inches higher than the maximum of 1896. On 1st April 1898 the depth was 17'33 feet above lowest sluice, or nearly 2 feet higher than at commencement of the year. As the rains held off till the 12th July, and the tank was getting almost as low as it had ever reached by that date, considerable anxiety was aroused by the possibility of the tank failing if the rains were unfavourable or altogether held off, and the necessary preliminary arrangements were made to put down the Budha Pushkar water-supply scheme, if this should turn out necessary. One result of the enquiries instituted was to show that a considerable proportion of the necessary piping would always be available from certain firms in Calcutta in an emergency.

2. During the year the loss of water from all causes may be taken at 89 million cubic feet. Of this 17 million cubic feet were utilized by this town, 13 million cubic feet were lost in leakage, and 59 million cubic feet lost by evaporation and other causes. The corresponding vertical depths for these quantities are as follow:—

- 3. Leakage has been regularly measured, and was at a maximum during the months of September, December and January, being about 13,10,000 c. ft. for each of these months and at minimum in June of 8,01,000 c. ft.
- 4. Of the 17 million cubic feet which is estimated as having been utilized in town consumption, 16 million cubic feet were actually measured as supplied to the town and railway through the Naya gate cistern. The remaining 1 million cubic feet were used partly by the gardens at Foy Sagar and the hydrant on the road leading there, and partly delivered direct to the town without measurement through the Dehli-gate main. A meter is about to be put up on this high level main which does not pass through the Naya-gate cistern, and this quantity will in future be measured. Of the 16 million cubic feet which were measured, the Railway took nearly 5 million cubic feet or 31 million gallons, and private gardens, etc., in Cantonments used 1 million cubic feet. The population using the remaining 10 million cubic feet may be estimated at 50,000, so that the consumption per head in the city is 200 cubic feet per annum or 3'4 gallons per day nearly.
- 5. It will be seen that the leakage is not far short of the total consumption. Without some system of pumping it is impossible to utilize any of this, as it flows out at some 13 feet below the lowest sluice. If it could be used it would considerably extend the duration of supply of the tank, and might just obviate the necessity of installing the Budha Pushkar scheme in the event of one mousoon totally failing under certain circumstances.
- 6. The 12-inch main from the Foy Sagar to the distributing disterns is constantly to

March, and when there is a sufficient head of water, the Dehli-gate main, which is connected directly with the 12-inch main from Foy Sagar and the higher parts of the city and Kaisarganj, is allowed to flow continually during the hours of day-light. The Railway main and its branch to the Cantonment remains open day and night, but during the month of maximum demand, say, April to June, Dehli-gate main is only opened during certain hours in the morning and evening, and at the end of the Cantonment branch, the supply has also to be regulated during the hot months to enable all to have a sufficient supply.

- 7. During the year under review about 3,500 running feet of new private connections were added.
- 8. Regarding the purity of supply, the state of the water remains much as it was. It was analysed once before the rains in June, and twice after in September. On the latter occasion it was also examined bacteriologically. One sample, from a road hydrant, was found to contain germs of enteric fever. A tabular statement is attached of these analyses. The purity of the supply therefore leaves much to be desired. The catchment area contains three villages, distant 1½ to 2 miles, and cultivation with manuring is unrestricted and is carried on right up to the border of the tank. As it will be out of the question at present to buy up the land and villages and stop the evil at its source, the only alternative is to make efficient filtering arrangements. The scheme is now being worked out on the most modern lines, and it is hoped that funds may be obtained in due course to institute an efficient system of filtration. In connection with this the question of utilizing the leakage water is also being considered.

ANA SAGAR.

The depth of water above sluice on 1st April 1897, was 4.23 feet. The lowest level reached was 0.20 feet on 10th July, and the highest 7.02 on 27th August 1897, which was more than a foot lower than the maximum of the year before. On 31st March 1898 the depth in above sluices was only 3.73, the water of this tank is used mainly for irrigating the Kaisar Bagh and Doulat Bagh gardens and for the Dhobies' Ghats.

E. C. SPILSBURY, MAJOR, R.E., Executive Engineer, Ajmere Provincial Division.
